The '9600' and '1200' outputs are just audio, not data. The '1200' is probably de-emphasized and AC coupled, pretty much like an unsquelched speaker output. The '9600' output is flat and DC coupled.

Which GPS do you want to run at 12 volts? The ADS-GM1 takes 5 volts and WILL die if you feed it 12, but you don't need to worry about it with the OT2m - it'll get 5 volts from the OT2m's internal regulator.

I'll be calling the enclosure supplier this morning (again) about fixing the rear panels.

Peter Dakota Summerhawk wrote:
> Scott,
> Ok so I take it there some software that needs to be configured for this? And if you wire the OTM2 to the 9600 will it still TX for 1200 baud? I think direct wire is the best as its going to be a data related radio tracker/digi anyways. Question on the GPS, I was planning on running 12VDC on it, would that harm the GPS? I don't want to go frying the GPS right off the start.
Let me know and I hope that the cases you ordered some in.

Yeah, that's not an uncommon configuration. The tracker and digi functions shouldn't really affect each other at all - you just configure each as usual.

From: SM5YLG
Topic: 5431 Message: 5431

Hi!

I have an old KPC3+ and it will not start so I can´t connect to it, I have
done a reset and it says RAM ERROR, but then it doesn□t do anything more.

Does any body have a idea what I should do?

You may have to resocket the RAM chip?
Or else the RAM is bad. They do burn out sometimes, especialy if it was a less-that best batch. There is leaching involved with diss-similar metals, silicon invasion, etc.

Hope it's just dust bunnies!

Don't forget solder balls. I think that's killed a satellite or two.
Not sure if that's a concern with modern IC packaging. I remember
something about a test procedure that involved tapping the chips and
listening with a sensitive mic...

If it is bad, they're not terribly expensive to replace these days.

Try to replace the EPROM with a new copy. I just resurrected a KPC3 by putting a new EPROM chip (erase and reflash wasn't sufficient, had to buy a new blank EPROM), after finding out that the RAM itself is ok by swapping from a good working KPC3.

5436. Laptop/Pepro/Ui-view problem

Yahoo group: APRS (2007 — 2010)
Date: 2008-08-02 14:04:22 UTC
From: ltdoc
Topic: 5436 Message: 5436

This is for receiving information via RF, not the internet. I have an 'HP' laptop, am using SV4AGW's 'Pepro' program, and Ui-view. Up until just a few days ago it ran well, did exactly what it was expected to do. Now it doesn't, at all.
Only change was an 'up-grade' for the 'Conexant' sound card driver that was recommended by 'HP' (aside from all the other changes that are 'normal' for anyone doing this stuff, and using 'Vista'). I've 'un-done' the changes, other than the sound card driver, no change, so figure the driver is the problem. I've searched 'HP's site, found gobs of sound card drivers, recommended 'fixes', etc. Nothing specific for my particular laptop (identification problem with 'HP', am told that's normal?). Tried a 'step-back' on the driver, no help. Added the recommended 'MS' patch to make things work, no help. The original driver is NOT available from 'HP' (what's with that?). Been advised to do a "format C:" and reload the system from the 'recovery' disks. (But what happens to all the other stuff I have on the computer? I gotta do all that stuff again?!) Beginning to think it'd be easier just to buy another alptop (NOT 'HP'!).
Any and all help/advice would be appreciated! It'd be nice if that help and/or advice was not anatomically impossible, and sort of cheap.
Paul / W5LZ

If you created a system restoe point just before upgrading the driver (always a good idea) you can do a rollback to that point.

hi all

well i still have an old portable here that i want it to stay at an
radio site where i have a digi.

it is on Windows 95,,,,is there a software that i could install,

it is an 486 ,,,,again it is not new.

windows is running smootly i must say.

thanks for your help

APRS SA would work on that I think. Don't have the system requirements in front of me but will check.

You might be able to run UI-View 32. I know the requirements say P120 minimum, but I ran it mobile with static maps on a P75. It was a little slow loading larger maps, but worked fine otherwise. If UI-View 32 won't run, the 16 bit version will.

I am with Mike on this; APRS SA is not going to run on a system with 95 on it. Just got done checking on the system requirements and it's a memory hog. UI-View 16 or 32 might be a better choice.

Have you tried un-installing and re-installing UIView? It looks like
a linked library file got overwritten during the driver update. This
may solve your problem.

If you're just looking for a DOS Terminal Program to manipulate the TNC, I'd suggest an old copy of ProComm. Where you could find a copy in this day and age is another matter.

in response to Gervais:
>> I have an old portable that I want at a site where I have a digi. It's a 486 [running] Windows 95. Is there software
>> I could install?

What do you want that software to do? Run the digi as an intelligent, modern digi or be able to view and interact with the rest of the APRS network?

APRSDos will run on literally *any* PC-compatible computer from 8088's on up. As for "fancy maps ", the data from which any U.S. APRSDos map is made from is freely available for download from the US Geodetic Survey (see APRSDos' MAPMAKIN.TXT).

Maps for portions of Canada have been made as well. Look in ftp://ftp.tapr.org/aprssig/maps/PCMaps as well as VE3KBR's http://www.ve3kbr.com/aprs/aprs_maps_d.htm for maps of Ontario, Manitoba and Saskatchewan.

Again, the question is what this "digi site" installation is meant to do. If it's to run a digi, you might be better off using modern firmware. Kantronics' Version 9.1 works well, as does UI-Digi for TAPR-2 clones. For more information, see: http://www.ir3ip.net/iw3fqg/uidigi-e.htm .

For DOS-based digipeater software, you can take a look at: http://pe1mew.nl/digi_ned/?Welcome . Or, for a Linux box, try: http://sourceforge.net/projects/aprsdigi . 73

5449. Another one'a those questions.

For some reason I've lost my notes about making UI-View accept a
mapping source. As in adding 'PMSAT-7', or '8' to the map list. I
know I have that information here, somewhere, the question is...where!
More junk than I know what to do with, unfortunately (blame 'age',
it's a good excuse).
So, how do I do that? How do I make UI-View 'look' for those maps?

hi Arte,
i need a way to see the traffic going on 144.390,so i will connect my old laptop and if i could ,i would love to run a digi with a software
NOT the firmware i have .
i used to have an KPC3 version 8.2 and this tnc will be recycle to my PACKET NODE locally.
So i need a software that could be run in my laptop,works as a digi,i have connected an old freind,an old KPC2 which i will switch in KISS
mode for the job .

do you understand my need Arte?

thanks all that have answer yet my request ,i am sure many are following the tread here too

Hmm, looks based on my system atleast, running a linux os, with ax25
support, and digi software is going to use around 60-90mhz p2 cpu.

But then it will also depend on how many packets it's handling, I live
in a busy area.

Questions that came immediately to mind that I would rather not have
to dig to find that answer to include:

Can I / How do I connect an external 12 V source?

Would it work if I installed 8 NiMH batteries instead (Nominally 1.2V
each instead of 1.5). In other words, at what voltage does it quit
working?

Can I connect an external antenna? If so, How/ What kind of connector?

How does it connect to a computer to do the configurating? USB, RS-232?

Yes, if it's regulated. This unit requires voltage regulation, so you can't simply hook it up to your car electrical system. They sell the Micro-Volt 12 regulator for $15, for this purpose.

> Would it work if I installed 8 NiMH batteries instead (Nominally
1.2V
> each instead of 1.5). In other words, at what voltage does it quit

9 to 13.2 volts DC

>
> Can I connect an external antenna? If so, How/ What kind of
connector?

Yes. Your antenna needs a SMA male connector, RH thread, or a suitable adapter.

>
> How does it connect to a computer to do the configurating? USB, RS-
232?
>

They configure it for you prior to shipping. If you want to change the programming later, you must fabricate a custom cable using a DB-9 cable and a 2.5mm 3 conductor plug.

In a message dated 08/15/08 14:01:23 Pacific Daylight Time, de.ws8e@... writes:
Can I / How do I connect an external 12 V source?

There is a set of screw terminals on the boad to allow direct wiring of a regulated supply.

Would it work if I installed 8 NiMH batteries instead (Nominally 1.2V
each instead of 1.5). In other words, at what voltage does it quit
working?

It will work fine on 9.6 volts at somewhat reduced power. It will start going glitchy at about 6.1 volts

Can I connect an external antenna? If so, How/ What kind of connector?

Standard SMA Connector with right hand thread

How does it connect to a computer to do the configurating? USB, RS-232?

RS-232 through a 2.5mm programming jack.

5461. GPS Accuracy -- Relative vs absolute

Yahoo group: APRS (2007 — 2010)
Date: 2008-08-16 14:33:47 UTC
From: Jim Tolbert
Topic: 5461 Message: 5461

Running back to the desire for DAO packets..... I am assuming that with standard APRS packets having 2 decimal places and DAO having 3 decimal places that I will be locating a particular GPS receiver to an area that is an order of magnitude more precise. I am probably not saying this correctly, but with the standard APRS packet, I have an area of uncertainty of about 20' x 40' (in northern Wisconsin, US (N45,W92)). By moving to a DAO packet, I will have an area of uncertainty of about 2' x 4'.

If I have a bunch of GPS receivers of the same type, can I assume that the relative location is pretty good, even if the absolute location may be off a bit? I am really primarily interested in relative positioning.

Many thanks, all..... jt

That's always been my assumption, but I've never tested it in any rigorous way. I wanted to track players in a paintball field (~10 acres of woods) and generate a real-time map of where everyone was - never got around to testing the relative accuracy of the receivers, though. I really wanted to come up with a good system to show what direction each player was firing, but tilt-compensated electronic compasses are expensive...

Strap the compass to the gun...it'll be tilted a little but probably not by much, unless the field is hilly or the players start climbing trees and playing sniper...you'll get somewhat random directions until the gun is actually pointed at someone but if what you're trying to tell who they're shooting at you only need a direction fix when the gun is aimed--and therefore relatively level.

I'm not quite sure how it'd interface with a tracker but dgps might very well work also. Probably waaay overkill though. :D Also you'll want to make sure to turn compression off, as that also loses some accuracy.

I have my THD7 setup for the CQ message group. I have never observed a CQ message appear. Just wondering how often this particular message group is utilized?

Thanks
Dave

They're still not particularly cheap. I keep looking for something
suitable, though. It'd be mostly for the spectators, and for replay
purposes, to see the movement of each group and see who's shooting and
where. You'd also need an 'out' switch on each player that they could
trigger when they're hit.

Mic-E loses accuracy. Base91 has considerably better accuracy than a
standard APRS position.

I dunno how you got that compressed posit's are less accurate than
uncompressed.

For my lon/lat in maryland, usa

lat is accurate to 00 00.00015
lon is accurate to 00 00.0004

the accuracy of uncompressed is

lat 00 00.01
lon 00 00.01

That's incorrect: Standard APRS and Mic-E packets have about
40'x60' resolution where I live, whereas Base-91 Compressed packets
are about 2'x3', much better than the accuracy of a consumer-grade
GPS. You're certainly not losing GPS accuracy by using Compressed
packets. You are losing by using Standard APRS or Mic-E packets as
a typical GPS can provide about 6 meter accuracy these days given a
clear view of the sky.

The DAO extension is also much better than Standard APRS or Mic-E
packets, but very few APRS programs decode DAO at present (APRSdos
and Xastir?).

5472. Digital Communication Conference, 9/26-28, Chicago - Register by 9/1 & Save

Yahoo group: APRS (2007 — 2010)
Date: 2008-08-19 03:41:50 UTC
From: Mark Thompson
Topic: 5472 Message: 5472

The ARRL/TAPR DCC (Digital Communications Conference) is being held in Chicago on September 26 - 28, 2008.

The DCC will be at the Elk Grove Village Holiday Inn located in Chicago's northwest suburbs near O'Hare airport with a free airport to hotel shuttle and easily accessible from major interstate highways.

The DCC is the premiere, national, annual digital ham radio conference covering ALL the Digital Voice & Data technologies from HF to Microwaves.

There will be BOTH Technical & Introductory presentations covering all levels of experience with the digital modes and also an ARRL forum.

This year for the first time at the DCC there will be a D-STAR Friday Night event. We plan to have innovators, pioneers & leaders in D-STAR digital voice & data technology available to present and take your questions.

Icom will be at the DCC and TAPR plans to have it's 70cm & 23cm D-STAR digital voice & data repeaters operating at the DCC connected to the internet gateway.

You can get more information about the DCC at: http://www.tapr.org/dcc.html
A DCC advertisement is attached that can be published in your local club newsletters.

Reigster before September 1st & save $10 on your registration fee.

You can register at:
https://www.tapr.org/dccregistration.php
Look forward to seeing everyone at the DCC.

You can use the IC-2820 internal GPS to feed the GPS data to D710. I
have been using RC-D710 and IC-2820 combo for six months and had great
success.

Use the DATA JACK (not PACKET JACK) on the back of 2820 to get the GPS
data, which can be transferred directly to the RC-D710.

Jim,

You have to prepare a straight 3 pin cable with 2.5mm plugs on the
both ends.

Plug the cable in the DATA JACK on the IC-2820's back and the GPS JACK
on the side of D710 panel.

On the IC-2820 menu, you have to push the DATA key. See Page 8 of the
IC-2820 manual. When GD appears on the 2820 panel, the GPS data stream
is comming out of the DATA JACK.

Have fun!

5475. South Texas Balloon Launch carrying APRS and echolink this morning 10am Central

Yahoo group: APRS (2007 — 2010)
Date: 2008-08-23 12:46:12 UTC
From: Craig
Topic: 5475 Message: 5475

We are going to try an experiment this morning and put the balloon's cross band
repeater on IRLP conference channel 9071 which is bridged to Echolink node KL7TQ (node number
84828). This will be a two way link. You should be able to talk as well as listen
to the cross band repeater over echolink and IRLP.

You can also track the balloon on APRS. The callsign is w5acm-9

The balloon will rise to 100,000 feet and have a repeater coverage of 500 miles but if you are too far away to hear the balloon on the 446 MHz downlink directly then
give echolink or IRLP a try.

We may even get someone to announce pre launch status of the balloon team over the
echolink node.

Launch time is 10am Central on Saturday August 23rd.

To the edge of space!!

5479. The ARRL Digital Technology for Emergency Communications Course

Yahoo group: APRS (2007 — 2010)
Date: 2008-08-28 20:41:12 UTC
From: Mark Thompson
Topic: 5479 Message: 5479

The ARRL Digital Technology for Emergency Communications Course
-- "This course is a great starting point for anyone interested in the public service applications of digital communications technology." Steve Ford, WB8IMY-Course Author and QST editor/ARRL Publications Manager

In this course, we will introduce you to all the ways Amateur Radio operators are using digital technology as a valuable emergency communications tool. The topics discussed during the course include:
* Packet radio APRS
* Winlink 2000
* IRLP
* EchoLink and WIRES-II
* D-STAR
* APCO25
* HF sound card modes
* Automatic Link Establishment (?ALE?)
We?ll help you answer questions such as:

Can you transfer supply lists or personnel assignments between emergency operations sites?

Can you get critical e-mails to the Internet if a connection goes down?

Can you relay digital images of damage at specific locations?

Can you track the locations of emergency personnel and display them on computer maps?
?and more!
Illustrations, screenshots, Internet links and audio files are used to demonstrate transmission modes and equipment configurations. Bite-sized learning units and interactive knowledge checks make learning interesting and fun!
System Requirements (minimum) ? Microsoft Windows? Vista/XP/2000/NT/98/95 or Apple OS X, 200 MHz processor, 32 MB RAM, sound card and speakers, 4-speed CD-ROM drive or higher. Requires Web browser; Microsoft Internet Explorer? 6.0, Mozilla Firefox 2.0, Apple Safari 3.0?or later versions. Some documents require Adobe? Reader?.
Also available: ARRL's HF Digital Handbook
Self-study. CD-ROM, version 1.0. ? 2008, The American Radio Relay League, Inc.
(ISBN: 0-87259-124-7) #1247?--?$49.95

Coming in September!

5480. WinAPRS 2.8.5 fails to update position.

Yahoo group: APRS (2007 — 2010)
Date: 2008-08-31 18:31:05 UTC
From: Craig
Topic: 5480 Message: 5480

Runing 2.8.5 under XPp. For what ever reason I may go 10-12 hours without being updated. I can manually (F2) post my position and 5 seconds later I am known again.

Position update is set for 30 minutes and the rst of the setting are mostly out of the box and is a register copy.

Anyone have any ideas?

5481. Re: WinAPRS 2.8.5 fails to update position.

Yahoo group: APRS (2007 — 2010)
Date: 2008-09-02 00:28:42 UTC
From: Bill P.
Topic: 5480 Message: 5481

The fact that it does work once is a while is helpful, my stock
questions follow:

Are you registered?
ARe you connected via RF or the internet?
Are you on HF or VHF?
Is the appropriate HF/VHF box checked in the schedule
If operating on RF and not the internet, how reliable is the
connection to the digi/igate from your QTH or along your route ?
Is 16 watts output adequate for your terrain?

Depending on activity, the posit beacon can be slow getting into the
network and into the servers. A copy of your last beacon on //aprs.fi
follows.

Assuming you are using UI-View32, go to

http://www.apritch.myby.co.uk/uiv32.htm

Click on the flag of your choice (English is the British flag), enter your name and callsign and wait a few hours (maybe as long as 2 days in my experience). After that, go back to the SAME page, click the SAME flag, enter the SAME information, and click Previously Registered. Your UI-View Registration Code and APRS Server Validation Number will be there.

If you're using other software, check with that software author for details of acquiring your validation number. It is up to the individual APRS client authors to provide this service.

5492. GPS Upgrade

Yahoo group: APRS (2007 — 2010)
Date: 2008-09-07 22:48:16 UTC
From: Dave
Topic: 5492 Message: 5492

I'm looking for a GPS in the $300 range to use on APRS with D700. Which of the new Garmins work. I tried asking the RS geek but he gave me a dumb look when I asked about PC connection and NMEA output. He never heard of such a thing.

5493. Re: [APRS] GPS Upgrade

Funny you should ask... I was just about to post an update on my new project.

None of their vehicle navigation units have NMEA out, as far as I know. Some of the chart plotters do, like the GPSMAP 276C. It's mostly the marine-oriented products that have NMEA out these days.

But there IS hope... most of the newer nuvi and StreetPilot models have a fleet management interface mode where the USB connector turns into a serial port. The bad news is that it uses Garmin's proprietary binary protocol, and my Tracker2 has been the only thing that's been able to use that for APRS so far. The good news is that I just got the first prototypes of my Garmin / NMEA converter working. Here's a picture of a nuvi 350 connected to a TH-D7A:

http://n1vg.net/images/nuvi_d7.jpg

Notice that there are APRS stations displayed on the screen - the converter is bidirectional and will accept NMEA and Kenwood proprietary waypoint sentences. It'll use the symbol information provided by the D710 and chose the most appropriate symbol to display, but so far I have only tested that with sample data provided by D710 users - I don't have one myself. So far only the nuvi 350 is known to work 100% with the waypoint display. Some units create duplicate waypoints, and some just don't display anything. Garmin's supposed to be coming out with a new POI management protocol, I hear... so maybe that'll change.

You can't really see the converter cable in that picture, so here's another that shows it more clearly:

http://n1vg.net/images/nmea_converter.jpg

This one has a DB9 on it for testing purposes. The board is about 1 cm wide and 2 mm thick. The USB cables in these pictures are a little thinner than they were supposed to be, thanks to a factory error. Eventually I'll probably have the boards overmolded onto the cables, but for now it's just in adhesive-lined heat shrink tubing.

Production will be starting soon, and I'm planning on a retail price of $48. I've only got parts on hand to build 4 or 5 of these things at the moment (and soldering a 7mm 48QFN package by hand is really tedious), and I've already got a bunch of beta testers lined up, so it'll probably be a few weeks before they're available. If anyone's curious, here's the actual PCB:

http://n1vg.net/images/nmea_pcb.jpg

Anyway, a nuvi 350 ($200 at Amazon.com) plus this converter cable should
be well under your $300 target.

Time to email the cable factory and see if my USB cables are done yet...

A couple of clarifications...

> None of their vehicle navigation units have NMEA out, as far as I know.

None of their CURRENT models, that is. I think some of the older ones did.

> one myself. So far only the nuvi 350 is known to work 100% with the
> waypoint display. Some units create duplicate waypoints, and some just
> don't display anything. Garmin's supposed to be coming out with a new

What I meant here is that other models, aside from the 350, exhibit
different behavior. Any nuvi 350 should work if it has the current
firmware.

You don't need to spend anywhere near $300. You just need a good, sensitive GPS that provides NMEA0183 output. The sensitivity is pretty much exclusively a function of the chip, since most have the antenna integrated with the chip. Garmin now uses the SiRFStar III chip in their GPS's (like my new nuvi 760) but for your purpose I would get the GPS that Scott sells for $53 using the same chip - see https://www.argentdata.com/catalog/product_info.php?cPath=23&products_id=85 (or http://tinyurl.com/6fjncm).

Hand Held Garmins: The Garmin eTrex Legend and the Garmin GPS60MapCSX have Serial output. In addition the GPS60 has Serial and USB output. Each work fine with the Kenwood TH-D7, D700 and the D710.

The GPS60 has the more sensitive SIRFIII chip set while the Legend does not. You will want the more sensitive chip set if you live in the city or anywhere where you will be under thick trees.

One of the older Megellan handhelds also has Serial output.

Serial might be RS232 +/- 9 to 15 volts or 0 / +5 volts. I have found the above Garmins and the Megellan to work fine on my Kenwoods and TinyTrak3 & TinyTrak4.

If you only want a cheapo hocky puck receiver I recommend any serial receiver at DeluoElectronics.com. A 12volt puck is less trouble to install.

If you want a SIRFIII hockey puck receiver you'll have to look a little harder so give DeluoElectronics.com a phone call. Also Contact Byonics.com since they have them ready to go.

In the case of the Garmin units and the older Megellan, they will transmit and display (2-way) APRS data.

Prices vary widely on the web, I have had good luck with them all.

From: Bill P.
Topic: 5492 Message: 5500

The Serial interface on the Garmin eTrex Legend and the Garmin GPS60MapCSX have selectable Text output, NMEA mode & Garmin mode which makes them fully compatible to ham gear and the TinyTrak3/4.

Setup Menu, Interface Menu , etc . NMEA is 4800 baud, NMEA9 is 9600 baud to the PC or rig serial interface.

There is a really neat program call GPSTrackmaker that will download your tracks and overlay them onto Google Earth. Nice for recalling your travels through unusual places ..... like Iberia and north Africa, even the streets of London .....

5503. Low power digi recomendations.

Yahoo group: APRS (2007 — 2010)
Date: 2008-09-11 03:21:07 UTC
From: Bruce Coates
Topic: 5503 Message: 5503

Hi

Our club is investigating installing a digi at a very remote location. The only power source will be solar and even that has to be shared with some other radio equipment. We have a radio that only uses 30 mA on receive and we're looking for a TNC that's equally frugal. I'm open to any suggestions. The only other requirements are that it fully support N-Paradigm and can be administered over the air. All of our other sites run UIDIGI firmware but that's only a nice to have.

Thanks

Bruce - VE5BNC

Kantronics KPC3+ you can turn off the LED's and get the draw down to
about 15ma.

I've got several at Solar sites, and also use the A to D telemetry
interface to monitor the battery voltage and Solar output.
<http://n0nhj.net/aprs/solar/>

The 3+'s also support the N-Paradigm, and do allow remote
access/administration.

Best of luck on your project.

Hi Bruce,

The Tracker2 does pretty well for power consumption. My bench power supply was showing around 20 mA today when I was working on a test unit. 30 mA should be about max. You could conceivably save 2-3 mA by replacing the voltage regulator with an LDO type, but you'd probably also need to replace the output filter capacitor with a larger, low ESR type to be stable.

No problem with digi operation, and it's remotely configurable through APRS messages, so you can access it through an IGate, assuming the IGate is set up properly. You also get temperature and voltage telemetry in the status packet, and hooking up a weather station is really simple.

(As I think most people here know, the Tracker2 is my product, so I'm probably a little biased.)

Chuck
by chance,do you know any surplus store that are selling solar panel or windchargers???
i may need some for a remote site i am working on

i know it may appear OTopic,thnak to the moderator if it pass the filter

I'm curious, is that 30mA at 12v with open squelch?

Hi Patrick

It's actually a Motorola MX360 will all of the unnecessary modules removed. Since we're using low level audio, it also includes removing the audio power amp. It runs off 7.5 to 8 volts. I've used one as my igate for years.

5509. ARRL/TAPR Digital Communication Conference, Chicago, September 26 - 28

Yahoo group: APRS (2007 — 2010)
Date: 2008-09-11 22:17:59 UTC
From: Mark Thompson
Topic: 5509 Message: 5509

http://www.arrl.org/news/stories/2008/09/11/10327/?nc=1

ARRL, TAPR Prepare for Digital Communications Conference in Chicago, September 26 - 28

Aficionados of digital communications are gearing up for the 27th annual ARRL/TAPR Digital Communications Conference (DCC) September 26-28 in Chicago, Illinois. The ARRL/TAPR Digital Communications Conference is an international forum for radio amateurs to meet, publish their work and present new ideas and techniques. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. The DCC is for all levels of technical experience -- not just for the expert. Not only is the conference technically stimulating, it is a weekend of fun for all who have more than a casual interest in any aspect of amateur digital electronics and communications; introductory sessions are scheduled throughout the conference to introduce new technical topics for both beginners and experts.

Topics at the DCC include, but are not limited to: Software defined radio (SDR); digital voice (D-STAR, P25, WinDRM, FDMDV, G4GUO); digital satellite communications; Global Position System (GPS); precision timing; Automatic Position Reporting System (APRS); short messaging (a mode of APRS); Digital Signal Processing (DSP); HF digital modes; Internet interoperability with Amateur Radio networks; spread spectrum; IEEE 802.11 and other Part 15 license-exempt systems adaptable for Amateur Radio; using TCP/IP networking over Amateur Radio; mesh and peer-to-peer wireless networking; emergency and Homeland Defense backup digital communications; using Linux in Amateur Radio; updates on AX.25, and other wireless networking protocols.

QEX Editor Larry Wolfgang, WR1B, will represent the ARRL at the Conference. He will also be giving a talk "Writing for Publication -- It's Not Rocket Science (Even if You Are Writing About Rocket Science!)." Retired ARRL Chief Technology Officer Paul Rinaldo, W4RI, will also represent the League. Rinaldo will speak on "SDR Outlook."

The DCC provides a separate (and lockable) room for participants to bring and show off their latest projects. Tables and power will be provided. Participants are encouraged to bring their own equipment and display for all to see, learn, and ask questions about, as well as a small sign and/or flyer naming and describing their project.

D-STAR digital voice and data will be the focus of the DCC Friday evening session. Pioneers and leaders in D-STAR digital voice and data technology will be presenting the technical innovations in D-STAR and how it is being used worldwide. In addition to the Friday evening session, ICOM will be at the DCC demonstrating D-STAR radios in the demonstration room, and TAPR's 70 cm and 23 cm D-STAR digital voice and data repeaters (KT7APR) with Internet gateway will be on the air.

Sunday Seminar Speaker Announced

Each year, the DCC hosts an in-depth 4 hour seminar on Sunday. Past seminars have included such topics as Software Defined Radios, Spread Spectrum Design and Theory, RD Design and Deployment, PICmicro MCU Design and Development, Packet Radio Networks with Millions or Billions of Stations and others. Seminars are given by experts in their field -- this year is no different. Phil Harman, VK6APH, will present "Software Radio Through the Looking-Glass."

Harman, licensed for more than 40 years, has worked on leading-edge RF techniques related to receivers and transmitters. His current passion is the development of fully digital HF radios. Harmon co-writes the Software Defined Radio column in the RSGB Radio Communications journal and also co-authored the SDR chapter in the latest RSGB Handbook. He will guide participants through the basics of SDRs right up to the very latest techniques that digitize signals directly at the antenna socket. Using diagrams and a minimum of math, Harmon will cover such subjects as front end design, mixers, I and Q signals, digital up and down conversion, AGC techniques, noise blanking and high efficiency power amplifiers. The presentation will be highly interactive, so be sure to bring along that question that has been puzzling you for so long!

Conference presentations, meetings, and seminars will be held at the Holiday Inn Hotel Elk Grove Village, Illinois. It is highly recommended that participants book rooms prior to arriving. A block of rooms at the special DCC room rate of $89.00 single/double is available; this rate is good until the block is all sold out. The hotel provides a complimentary shuttle to and from O'Hare Airport.

Register for the DCC at: www.tapr.org/dcc

5510. Missing Weather Data

Yahoo group: APRS (2007 — 2010)
Date: 2008-09-12 01:26:14 UTC
From: kg4pid
Topic: 5510 Message: 5510

I was just checking on my weather station on Findu and noticed that data for 09/09/08 is missing. Then I looked at other stations around me and it's missing for them as well. It was there on the morning of 09/10/08. Anyone know what happened?
My weather station is KG4PID-15.

Thanks, Max

Dear APRS Community:
DE Cliff, AC6C. I am writing in my capacity as Chair of the SAR City Ham Radio Track. SAR City is in its 36th year. It is the regional search and rescue school. in the southwest US. Yearly about 400-500 people come to Barstow College in Barsow CA, about half-way between LA and Las Vegas. Last year I was tasked with restarting ham radio at SAR City. We licensed 16 people and were pcitured in May 2008 QST, pg. 13.
This year, Oct. 11, we will again run the ham track. K9 handlers at SAR City have been asking me about APRS. I invited Yaesu to come demo their VX8R but it might not be ready for Oct. 11. I have been trying to find APRS people in So. Calif. who can come do a demo for the k-9 handlers but have been unsucessful. Do you know anyone who might bewilling to come? Please email me off line - mycallsign ---at--- ARRL --dot-- net

Hi Cliff,
I see some very good people in your area and i am sure
that they will help
if you click on this link you will see a map etc of your area

http://aprs.fi/?addr=%20BArsow%20%20california%20usa&timerange=3600

If you zoom out a little and then click on show all you will see some
callsigns that may be
able to help.

Another way to attract some attention is by placing an object in the area
advertising the event go look
there should be one there now.

Cliff,

You might want to contact Scott Miller of Argent Data Systems directly at scott@... He is the creator of the famous OpenTrackers and heavily involved in SAR activty. He might be willing to help you out, but don't quote me on that ;o)

I would love to come and demo my latest RTrak-SAR, but I have neither the time or money to make it out there.

5519. Tracked Stations Jumping Back and Forth

Yahoo group: APRS (2007 — 2010)
Date: 2008-09-13 19:26:27 UTC
From: lweaver
Topic: 5519 Message: 5519

Hello,
I am new to APRS and have been using AGWTracker to watch a few mobile stations moving around the country. I've notice that a lot of them will jump back and forth while being tracked even though they are always moving in one direction in reality. Could someone give me a explanation as to why I am seeing this? I have searched the group without success.

Thanks,
Larry

Hi Larry,
When you mean jump back and forth is this just within your
area
or jump overseas then return.

If its the first 1 then it maybe a problem with the tracker or GPS not
locking

If its the second then it could be a trashed Mic-E beacon
to read more on this look here

The reason mobiles jump back and forth is because multiple IGATES are reporting the data but there is a delay between the packets of greater than what the APRS servers look for when looking for duplicates. I think the packets need to arrive within 30 seconds to be considered a duplicate. This can be reduced if the transmitting mobile reduces the number of hops it wants it packets to take.

Recently I accidentally had my home station and my mobile operating with my call sign but both without a SSID. Both were beaconing at different times. Consequently my location would at one moment show up as my home QTH and the next I would appear to be mobile about 50 miles away. Perhaps this may be the type of situation that is causing the jumping of stations that was observed.

Thank you all for your responses. I believe what Fran described
is what I am seeing on my end. I started looking at the digi path of
stations who were moving in a normal path compared to stations who
were randomly reversing paths and the "jumping around" stations were
using longer paths. This is happening in an area where there are
numerous high level digis, probably too many in fact. This is all
just a guess on my part. :o)

Thank you again,
Larry

5524. QST for N Calif -- APRS Users gathering @ Pacificon Sunday Oct 19th 8:00am

Yahoo group: APRS (2007 — 2010)
Date: 2008-09-14 00:53:00 UTC
From: w6dtw
Topic: 5524 Message: 5524

Greetings,

Pacificon management has generously agreed to let us host an APRS Users gathering on Sunday at 8:00am. In addition to being an opportunity to have an eyeball-QSO with your fellow APRS users this session will provide information and and an opportunity for us to collaborate on making our local APRS system even better.

KE6AFE and I will present, and I've also invited N6NU to join us. We'll review the information sources available to local APRS users, talk about the technical challenges we'll likely face in the coming years, and then lead an open discussion about strategies for dealing with those challenges. I will also present some details on how we combined traditional DF/T-hunt techniques with APRS-IS data analysis to locate and resolve the mysterious "144.390 carrier" issue back in August.

I hope you will join us for this session, and look forward to meeting everyone! Pacificon schedule is online at:

http://pacificon.org/Forums.html

Register for Pacificon at:

http://pacificon.org/Buy.html

Talk-in will be on 147.060, + offset, 100Hz.

73,

...dtw

5525. Re: Tracked Stations Jumping Back and Forth

in my area, Mid TN there are a couple of JAVA APRS stations that frequently cause this "jumping back and forth" you have mentioned. it appears that they take the data from the intenet after it has been properly I-gated and re-introduce it as new data. Therefore, you see stations appear to go back and forth. I have gotten home and then watch myself come home again on UI-View. it is exrememly aggrevating, but you can use the raw data of a particular station and delete the suspected data to see a real time track of the station you originally wanted to watch. While this isn't really a good explanation for your question, I am just letting you know that it appears to be common among those using the JAVA software.

Hi,

Thanks for the Heads Up on the APRS Forum. Now, I will try harder to attend the convention. I was disappointed that I have not been seeing more APRS related forums at previous Pacificon.

Here is one item that I am particularily interested in seeing addressed during this forum. IMHO, "I would like to see 146.520 used by more of the mobile units. It is somewhat frustrating that when traveling, you see someone on the road on the GPS sending position reports on APRS and you are not able to contact them."

Thanks again,

73,

Jim - N6JIM

5527. Stations Jumping Back and Forth

Yahoo group: APRS (2007 — 2010)
Date: 2008-09-15 19:42:08 UTC
From: Phillip
Topic: 5527 Message: 5527

Hi Jack,
Have you mentioned this to the author of javaaprs
Pete Loveall AE5PL

How about supplying some station info (callsigns) of jumping
stations etc so that these can be looked at and see what is happening

If you could capture some of the raw data of this it would help locate
the problem stations causing this looping / jumping data

From: Lynn W. Deffenbaugh (Mr)
Topic: 5527 Message: 5528

I suspect it isn't because of the Java code, but because of how the server is being used. If you connect a gating client to a history-reporting port, the previous 30 minutes of data will arrive first and possibly be relayed back into the system as new data. These history buffering ports (10153 and 20153 typically) are designed for client-only connections, not for servers, but there's no way to tell the difference. People get their "favorite" port that works for one thing and just use it for everything without thinking.

Remember, if you're only monitoring APRS-IS, nothing you do can hurt. But if you're gating APRS-IS to RF and/or vice-versa, I don't think you should be using a history buffering port! At least,my logic says that would be a bad idea (gating 30 minute old data to rf to be repeated and gated back in somewhere else as new packets. And this seems contrary to what http://www.aprs-is.net/APRSServers.aspx says, so if anyone has a better understanding than me, please let me know!

5529. Re: [APRS] Stations Jumping Back and Forth

Yahoo group: APRS (2007 — 2010)
Date: 2008-09-15 22:00:04 UTC
From: Patrick Domack
Topic: 5527 Message: 5529

Using the history port I would put as a bad idea, cause if you really need 30min of back history, your igate isn't very reliable. If the connection drops, I can see it might be usefull to see the last 2min of data at the most. But this is why there can be more than one igate also, so it shouldn't be needed. If you internet goes flacky, and you reconnect once every 5min, you would replay the same packet 7 times in 30min, if there was more than one packet being replayed, it just keeps getting worse.

Data gated from aprs-is to rf is not gated back to aprs-is, and if it is, it's suppost to be dropped. So that part of it shouldn't be an issue.

Quoting "Lynn W. Deffenbaugh (Mr)" <ldeffenb@...>:

DCC Forum Schedule Announced and Available at:

http://www.tapr.org/pdf/DCC_2008_Schedule_Preliminary.pdf (and may be attached)

DCC Presentations Include:

Bob Bruninga, WB4APR, APRS

Phil Harman, VK6APH, Software Defined Radio

Rick Muething, KN6KB, New Soundcard Mode for Winlink

Paul Rinaldo (ARRL), W4RI, SDR

Larry Wolfgang (ARRL) , WR1B, QEX Editor

D-STAR Technical & Introductory Presentations AND D-STAR Friday Night Get Together including
 - Robin Cutshaw, AA4RC, DV Dongle, dplus, D-STAR Reflectors & more
 - Pete Loveall, AE5PL, D-PRS
 - Dan Smith, KK7DS, D-RATS & D-STAR Digital Messaging
 - Ray Novak, N9JA, Icom

Banquet Keynote Speaker, Tom Clark, K3IO, AMSAT

and many more...

Register for the DCC at: www.tapr.org/dcc

http://www.arrl.org/news/stories/2008/09/11/10327/?nc=1

ARRL, TAPR Prepare for Digital Communications Conference in Chicago, September 26 - 28

Aficionados of digital communications are gearing up for the 27th annual ARRL/TAPR Digital Communications Conference (DCC) September 26-28 in Chicago, Illinois. The ARRL/TAPR Digital Communications Conference is an international forum for radio amateurs to meet, publish their work and present new ideas and techniques. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. The DCC is for all levels of technical experience -- not just for the expert. Not only is the conference technically stimulating, it is a weekend of fun for all who have more than a casual interest in any aspect of amateur digital electronics and communications; introductory sessions are scheduled throughout the conference to introduce new technical topics for both beginners and experts.

Topics at the DCC include, but are not limited to: Software defined radio (SDR); digital voice (D-STAR, P25, WinDRM, FDMDV, G4GUO); digital satellite communications; Global

Position System (GPS); precision timing; Automatic Position Reporting System (APRS); short messaging (a mode of APRS); Digital Signal Processing (DSP); HF digital modes; Internet interoperability with Amateur Radio networks; spread spectrum; IEEE 802.11 and other Part 15 license-exempt systems adaptable for Amateur Radio; using TCP/IP networking over Amateur Radio; mesh and peer-to-peer wireless networking; emergency and Homeland Defense backup digital communications; using Linux in Amateur Radio; updates on AX.25, and other wireless networking protocols.

QEX Editor Larry Wolfgang, WR1B, will represent the ARRL at the Conference. He will also be giving a talk "Writing for Publication -- It's Not Rocket Science (Even if You Are Writing About Rocket Science!)." Retired ARRL Chief Technology Officer Paul Rinaldo, W4RI, will also represent the League. Rinaldo will speak on "SDR Outlook."

The DCC provides a separate (and lockable) room for participants to bring and show off their latest projects. Tables and power will be provided. Participants are encouraged to bring their own equipment and display for all to see, learn, and ask questions about, as well as a small sign and/or flyer naming and describing their project.

D-STAR digital voice and data will be the focus of the DCC Friday evening session. Pioneers and leaders in D-STAR digital voice and data technology will be presenting the technical innovations in D-STAR and how it is being used worldwide. In addition to the Friday evening session, ICOM will be at the DCC demonstrating D-STAR radios in the demonstration room, and TAPR's 70 cm and 23 cm D-STAR digital voice and data repeaters (KT7APR) with Internet gateway will be on the air.

Sunday Seminar Speaker Announced

Each year, the DCC hosts an in-depth 4 hour seminar on Sunday. Past seminars have included such topics as Software Defined Radios, Spread Spectrum Design and Theory, RD Design and Deployment, PICmicro MCU Design and Development, Packet Radio Networks with Millions or Billions of Stations and others. Seminars are given by experts in their field -- this year is no different. Phil Harman, VK6APH, will present "Software Radio Through the Looking-Glass."

Harman, licensed for more than 40 years, has worked on leading-edge RF techniques related to receivers and transmitters. His current passion is the development of fully digital HF radios. Harmon co-writes the Software Defined Radio column in the RSGB Radio Communications journal and also co-authored the SDR chapter in the latest RSGB Handbook. He will guide participants through the basics of SDRs right up to the very latest techniques that digitize signals directly at the antenna socket. Using diagrams and a minimum of math, Harmon will cover such subjects as front end design, mixers, I and Q signals, digital up and down conversion, AGC techniques, noise blanking and high efficiency power amplifiers. The presentation will be highly interactive, so be sure to bring along that question that has been puzzling you for so long!

Conference presentations, meetings, and seminars will be held at the Holiday Inn Hotel Elk Grove Village, Illinois. It is highly recommended that participants book rooms prior to arriving. A block of rooms at the special DCC room rate of $89.00 single/double is available; this rate is good until the block is all sold out. The hotel provides a complimentary shuttle to and from O'Hare Airport.

Register for the DCC at: www.tapr.org/dcc

Hi ,
I X posted this to Pete Loveall for his comments ::

That is an incorrect problem diagnosis by Jack. The issue is probably the use of a KPC-3+ TNC in KISS mode. The problem described "gotten home and then watch myself come home again" implies extended (on the order of minutes) delays. These are normally caused by the KPC TNCs getting confused in KISS mode and causing extensive delays in packets received (and therefore transmitted) on RF. There is nothing in the javAPRSSrvr or javAPRSIGate code that would cause these types of delays.

We see this on RF quite often with a KPC is being used as a digipeater in KISS mode with external software. The problem appears to be tied to sending packets to the TNC while it is receiving data. Remember that even in KISS mode an entire packet is received before being sent to the software due to CRC checking. Therefore it is impossible for the software to know if a packet is in the process of being received.

You might want to enlighten that group to look deeper than just to software they are not familiar with. But that is up to you ;-)

73,

Pete Loveall AE5PL

Participants are encouraged to bring their own equipment and display for all to see, learn, and ask questions about, as well as a small sign and/or flyer naming and describing their project.

D-STAR digital voice and data will be the focus of the DCC Friday evening session. Pioneers and leaders in D-STAR digital voice and data technology will be presenting the technical innovations in D-STAR and how it is being used worldwide. In addition to the Friday evening

session, ICOM will be at the DCC demonstrating D-STAR radios in the demonstration room, and TAPR's 70 cm and 23 cm D-STAR digital voice and data repeaters (KT7APR) with Internet gateway will be on the air.

Sunday Seminar Speaker Announced

Each year, the DCC hosts an in-depth 4 hour seminar on Sunday. Past seminars have included such topics as Software Defined Radios, Spread Spectrum Design and Theory, RD Design and Deployment, PICmicro MCU Design and Development, Packet Radio Networks with Millions or Billions of Stations and others. Seminars are given by experts in their field -- this year is no different. Phil Harman, VK6APH, will present "Software Radio Through the Looking-Glass."

Harman, licensed for more than 40 years, has worked on leading-edge RF techniques related to receivers and transmitters. His current passion is the development of fully digital HF radios. Harmon co-writes the Software Defined Radio column in the RSGB Radio Communications journal and also co-authored the SDR chapter in the latest RSGB Handbook. He will guide participants through the basics of SDRs right up to the very latest techniques that digitize signals directly at the antenna socket. Using diagrams and a minimum of math, Harmon will cover such subjects as front end design, mixers, I and Q signals, digital up and down conversion, AGC techniques, noise blanking and high efficiency power amplifiers. The presentation will be highly interactive, so be sure to bring along that question that has been puzzling you for so long!

Conference presentations, meetings, and seminars will be held at the Holiday Inn Hotel Elk Grove Village, Illinois. It is highly recommended that participants book rooms prior to arriving. A block of rooms at the special DCC room rate of $89.00 single/double is available; this rate is good until the block is all sold out. The hotel provides a complimentary shuttle to and from O'Hare Airport.

There's a new laptop category: mini. HP, Lenovo, Asus, Dell and MSI all have sub-$500 notebooks with 8.9" to 10.0" screens. This is my question/idea: instead of an AvMap G5 with the Kenwood TM-D710A, how about a mini-laptop with a GPS puck with the TM-D710A? Since I'm really new to HAM/APRS, is there mapping/APRS software that I can install on the laptop, and interface with the TM-D710A, that will give the the same APRS functionality that the G5 has?

Laptop + GPS will cost less than the G5, and be more useful for other tasks. Even with software I think my total cost will be less than the G5.

Most any radio with a data jack will work just fine. Kenwood, Yaesu ad
Alinco (and I'm sure ICOM) - all make radios with dedicated data jacks.

Good luck,

The US version of the TM-271A doesn't have a data jack, but you can add
one easily enough. That's what's running my IGate right now.

I'm running the Asus 2G, Windows installed, with a Kenwood D7 and a USB GPS. I have Map Point, Streets and Trips and APRS Point installed on a 2 gig SD card. Works great. I took it to Germany and Switzerland this summer and had a ball from hotel rooms. Don't try to use it on the trains though as the windows block the GPS signals. I'm very pleased with the results.

I have been using this type of configuration for years with great success. I have a full-sized laptop, with a usb gps puck; and the laptop is also connected to either my TM-D700 or a cheap old 2m icom mobile via a serial-usb connection.

When using it with the TM-D700, the reporting stations are displayed on the laptop, and also on the TM-D700 screen.

The key to my continued success is that I use a program called APRSPoint. http://aprspoint.com/ It has worked flawlessly, and provides excellent coverage for urban, rural environments. Where it does not work well is in wilderness, which we have a lot of here on Vancouver Island, or in marine environments (also in BC)-- lacking the detail that are in the city maps.

For wilderness activities, I use OzExplorer; but you have to import or create your own maps.

Topic: 5544 Message: 5544

Hello All,
Anyone else out there using a TinyTrak III?? My setup worked for the longest time and now I don't show up anymore on FindU.com or UI-VIEW32 maps. The GPS works fine because you can see it lock on to a signal without a problem. What is the proper Digi Path to use?? My complete settings are as follows.

CallSign: N9MXT-9
Digi Path WIDE1-1,WIDE2-2
AUTO TX DELAY: 300 MILLISECONDS
MANUAL TX DELAY: 133 MILLISECONDS
MANUAL TRANSMIT RATE: 30 SECONDS
QUIET TIME: 525 MILLISECONDS
CALIBRATION: 128

SEND ALTITUDE
ONLY SEND VALID

MIC-E SETTINGS: ENABLED
SLOW SPEED: 5 MPH
MIN TURN ANGLE: 27 DEGREES
SLOW RATE: 90 SECONDS
TURN SLOPE: 255
FAST SPEED: 25 MPH
MIN TURN TIME: 5 SECONDS
FAST RATE: 60 SECONDS

Anyone see anything wrong with anything in here?? Besides transmitting prob to much!! Digi Path correct? What is the proper digi path??

Jeffrey - N9MXT

Jeffrey,

Your settings should work. I use WIDE1-1,WIDE2-1 your setting will just give one more hop. My Smart Beaconing setting
are just a bit different but yours should work.

Is your radio actually transmitting? Have another radio you can listen with? Are you able to see packets on a local
TNC radio?

5546. SEC/IL Request for Assistance with Area Frequencies/Beacons

Yahoo group: APRS (2007 — 2010)
Date: 2008-09-23 00:04:24 UTC
From: Mark Thompson
Topic: 5546 Message: 5546

----- Forwarded Message ----
From: R. Patrick Ryan <kc6vvt@...>
Sent: Friday, September 19, 2008 2:45:11 PM
Subject: SEC/IL Request for assistance with area frequencies/beacons

Working with a local IDOT amateur radio team recently formed up. The
mobile team will be equipped with the new Kenwood TM-D710A, for FM Voice
and Packet (APRS) use and travel to Southern Illinois in response to an
Earthquake drill, as well as public service radios and others mentioned.

Here is a brief summary of their intent.

"Six or eight of us need to get familiar with using the radio in simplex
and packet mode. We leave for southern Illinois on October 7, 2008.
Five of us with amateur radio licenses are going south and three with
their license will remain here. We have been tasked with demonstrating
simplex, packet, and echo link from the truck and trailer units back to
Ottawa, Springfield, and Carbondale during one part of the exercise. We
are hoping to find a list of repeaters between those locations that we
can use. Springfield will be using simplex and echo link to communicate
to us. Ottawa will be using all three modes of communications to us and
I'm not sure exactly what Carbondale Memorial Hospital has for radio equipment other
than an IEMA HF SSB radio like our District Office."

Your District and local support requested in suggesting some frequencies
to use in named areas to be visited, especially stations with Echolink
access.

While this model radio can grab and use the APRS announced repeaters and
Echolink equipped stations, can you or local contacts provide me with
suggested list of area open amateur radio frequencies to program into the
radio memory before departure from here?

Also do encourage area APRS beacons and Echolink users to update their
informational packet beacons, if needed, in preparation for this, too.
Refer to QST September 2008 article by WB4APR for background, and
references there,

This desired information and comments on the above would greatly
facilitate a fine local effort with some pretty well motivated Illinois
state employees and new amateur radio operators that form up this new
state agency in-house response team.

Not much room on an Asus after a XP install. Have to run most of your programs off SD card as the OS takes most if not all of the chip. I think they should have built it with bigger memory for a start. I run a CF-19 tough book with touch screen with no problem in the truck for aprs and found one on eBay $600 but had to load my own OS on it.

APRSPoint INCLUDES MapPoint. In fact, it's the cheapest way to get a legitimate version of Microsoft MapPoint. The APRS software is an overlay on MapPoint. And Streets and Trips data files can be used instead of the MapPoint data files.

No, I have not involvement with the APRSPoint people, other than being a satisfied user.

5552. WB4APR Presenting at DCC (Digital Communcaitons Conference)

Yahoo group: APRS (2007 — 2010)
Date: 2008-09-23 23:02:27 UTC
From: Mark Thompson
Topic: 5552 Message: 5552

The DCC (Digital Communications Conference) is in Chicago on September 26 - 28.

On Friday, 9/26 at 1:45 pm Bob Bruninga, WB4APR is presenting Frequency and Other New Initiatives in APRS since 2004

On Saturday, 9/27 at 11 am Pete Loveall, AE5PL is presenting Intro to D-PRS

DCC Forum Schedule Available at:
http://www.tapr.org/pdf/DCC_2008_Schedule_Preliminary.pdf (and may be attached)

DCC Presentations Include:

Bob Bruninga, WB4APR, APRS

Phil Harman, VK6APH, Software Defined Radio

Rick Muething, KN6KB, New Soundcard Mode for Winlink

Paul Rinaldo (ARRL), W4RI, SDR

Larry Wolfgang (ARRL) , WR1B, QEX Editor

D-STAR Technical & Introductory Presentations AND D-STAR Friday Night Get Together

Banquet Keynote Speaker, Tom Clark, K3IO, AMSAT

and many more...

Register for the DCC at: www.tapr.org/dcc

Walk-In Registration Welcome!!

http://www.arrl.org/news/stories/2008/09/11/10327/?nc=1

ARRL, TAPR Prepare for Digital Communications Conference in Chicago, September 26 - 28

Aficionados of digital communications are gearing up for the 27th annual ARRL/TAPR Digital Communications Conference (DCC) September 26-28 in Chicago, Illinois. The ARRL/TAPR Digital Communications Conference is an international forum for radio amateurs to meet, publish their work and present new ideas and techniques. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. The DCC is for all levels of technical experience -- not just for the expert. Not only is the conference technically stimulating, it is a weekend of fun for all who have more than a casual interest in any aspect of amateur digital electronics and communications; introductory sessions are scheduled throughout the conference to introduce new technical topics for both beginners and experts.

Topics at the DCC include, but are not limited to: Software defined radio (SDR); digital voice (D-STAR, P25, WinDRM, FDMDV, G4GUO); digital satellite communications; Global Position System (GPS); precision timing; Automatic Position Reporting System (APRS); short messaging (a mode of APRS); Digital Signal Processing (DSP); HF digital modes; Internet interoperability with Amateur Radio networks; spread spectrum; IEEE 802.11 and other Part 15 license-exempt systems adaptable for Amateur Radio; using TCP/IP networking over Amateur Radio; mesh and peer-to-peer wireless networking; emergency and Homeland Defense backup digital communications; using Linux in Amateur Radio; updates on AX.25, and other wireless networking protocols.

QEX Editor Larry Wolfgang, WR1B, will represent the ARRL at the Conference. He will also be giving a talk "Writing for Publication -- It's Not Rocket Science (Even if You Are Writing About Rocket Science!)." Retired ARRL Chief Technology Officer Paul Rinaldo, W4RI, will also represent the League. Rinaldo will speak on "SDR Outlook."

The DCC provides a separate (and lockable) room for participants to bring and show off their latest projects. Tables and power will be provided. Participants are encouraged to bring their own equipment and display for all to see, learn, and ask questions about, as well as a small sign and/or flyer naming and describing their project.

D-STAR digital voice and data will be the focus of the DCC Friday evening session. Pioneers and leaders in D-STAR digital voice and data technology will be presenting the technical innovations in D-STAR and how it is being used worldwide. In addition to the Friday evening session, ICOM will be at the DCC demonstrating D-STAR radios in the demonstration room, and TAPR's 70 cm and 23 cm D-STAR digital voice and data repeaters (KT7APR) with Internet gateway will be on the air.

Sunday Seminar Speaker Announced

Each year, the DCC hosts an in-depth 4 hour seminar on Sunday. Past seminars have included such topics as Software Defined Radios, Spread Spectrum Design and Theory, RD Design and Deployment, PICmicro MCU Design and Development, Packet Radio Networks with Millions or Billions of Stations and others. Seminars are given by experts in their field -- this year is no different. Phil Harman, VK6APH, will present "Software Radio Through the Looking-Glass."

Harman, licensed for more than 40 years, has worked on leading-edge RF techniques related to receivers and transmitters. His current passion is the development of fully digital HF radios. Harmon co-writes the Software Defined Radio column in the RSGB Radio Communications journal and also co-authored the SDR chapter in the latest RSGB Handbook. He will guide participants through the basics of SDRs right up to the very latest techniques that digitize signals directly at the antenna socket. Using diagrams and a minimum of math, Harmon will cover such subjects as front end design, mixers, I and Q signals, digital up and down conversion, AGC techniques, noise blanking and high efficiency power amplifiers. The presentation will be highly interactive, so be sure to bring along that question that has been puzzling you for so long!

Conference presentations, meetings, and seminars will be held at the Holiday Inn Hotel Elk Grove Village, Illinois. It is highly recommended that participants book rooms prior to arriving. A block of rooms at the special DCC room rate of $89.00 single/double is available; this rate is good until the block is all sold out. The hotel provides a complimentary shuttle to and from O'Hare Airport.

Register for the DCC at: www.tapr.org/dcc

From: w6dtw
Topic: 5524 Message: 5553

Greetings,

Just a quick update. In addition to the presenters I mentioned
earlier we've added the creator of OpenAPRS.Net -- Greg NV6G. Greg
will be talking about his vision for OpenAPRS, and will overview some
ideas for enhancing APRS in the Nor Cal area.

Looking forward to seeing you all there!

5555. Kenwood D700A Data Cable

Yahoo group: APRS (2007 — 2010)
Date: 2008-09-24 01:21:26 UTC
From: Dave
Topic: 5555 Message: 5555

Hello to the group,I have a question about the data cable.The data cable that came with the radio, I want to turn it into a data/power cable can I do that or do I have to buy the data/power cable?Being a dumdum I forgot to order the cable I want to see if I can do this myself.The GPS unit is a Garmin 5 forgot to mention that before....sorry.APRS is my favorite mode and don't forget about the next mission for ISS Astronaut Garriott is going to be operating from the Space Station in October!!!

Thanks All 73s

5556. Just a quick introduction....

N4AOF here, totally new to APRS. I used to be on packet about 15 years ago (yes FIFTEEN) but I quit bothering with packet when it became impossible to do anything but listen to the PBBS stations squawk back and forth at each other passing useless bulletins that were invariably garbled despite the error correction supposedly included n AX.25

I've been running dual-band 2m/70cm rigs for even longer than that, but I'm usually just on 2m; most likely 147.030

I picked up a new TM-D710A at the Louisville 'fest and just added a GPS-710 tonight (although I think I probably don't have something set right because it doesn't seem to be sending its position).

Eventually I'll figure this stuff out -- but probably not without asking more than my share of silly questions.

Hi Tom,
Welcome to the list.
No questions are silly.
Just ask and some one will help.
Wish I could afford a 710 but will have to stick with my 700.
73,
Robin ZL3REW

5558. APRS-IS IGate Behavior

Yahoo group: APRS (2007 — 2010)

>
>
Dave,

I've seen much the same thing. (BTW, can you give us the callsigns so we can see what you see)

I've got a receive-only IGate running (hopefully soon to go bi-directional). I see lots of packets coming through the gate and going to the Internet, but as you noticed, many of those packets show up later as gated by some other gate. I finally determined that this is a normal situation based on the nature of APRS-IS. Whichever gate delivers the packet FIRST to APRS-IS will be marked as the gating station. Subsequent deliveries will be detected as duplicates and discarded. What's even more interesting is if you monitor several core servers, you can actually receive a single packet showing different paths and/or different gates. Whichever server findu.com (or aprs.fi or whatever) is using is the view that that client will have.

Specifics:

K4EOC is a station fairly far north from me. It is RF-visible to a few digis and a couple of gates. Depending on the time of day, local RF conditions, INet traffic on the Gate's connection, various gates will see the packet gated. For instance, as I type this, aprs.fi's raw display shows this packet directly gating through my gate (KJ4ERJ), directly gating through W4KBW, also direct through KG4YZY-11. Sometimes it digis through W4IZ-1 and gates at K4GDX. At other times it digits through W4MIN and gates at WC4PEM. Sometimes it even directly gates through WC4PEM. And one time it even digi'd through W4MIN and gated through the SAME station! (Actually, I'm not sure if there's an old-style digi up there somewhere that is doing the WIDE*, haven't tracked that one down yet).

As for you gating another station and them gating you, that is also normal in my observations. Many stations only beacon themselves over the RF and don't directly gate their own beacon. When/if another gate hears the beacon, it gates it to APRS-IS which then shows up as a new packet gated by the receiving station. Your station may be doing the same thing. Your RF-only beacon is heard by the other gate and placed

into APRS-IS. Sometimes if your connection is slower or to a different server than the one feeding findu.com (or other history/viewing site on APRS-IS), you can see yourself gate it or the other gate doing the insertion. It's not truly random, but based on non-controllable, chaotic timings of the APRS-IS multi-tiered server distributed delivery mechanism.

Hopefully that'll clear up what you're seeing in the packet traces.

Lynn (D) - KJ4ERJ - Tracking as KJ4ERJ-12 (APRS-IS direct client) and KJ4ERJ-9 (a MicroTrak 300)

PS. I've cross-posted this to the APRS and javAPRSSrvr groups to see if anyone there with more experience and knowledge can confirm or correct my interpretation of what's happening here.

Have you been looking around the available resources?
Start in this list's web pages' files area in the maps folder can be a
good start.

5564. DCC (Digital Communications Conference) A Success & Returning to Chicago Next Year

Yahoo group: APRS (2007 — 2010)
Date: 2008-10-04 22:33:14 UTC
From: Mark Thompson
Topic: 5564 Message: 5564

http://www.arrl.org/news/stories/2008/10/02/10371/?nc=1

ARRL/TAPR Digital Communications Conference: "Pretty Interesting!"

The main presentation room at the 2008 ARRL/TAPR DCC provided ample seating and tables, as well as power supplies, for laptops. [Larry Wolfgang, WR1B, Photo]

Kermit Carlson, W9XA (left), and Rick Muething, KN6KB, go over the final arrangements just before Muething's presentation on audio/visual equipment. Carlson coordinated the a/v for the DCC. [Larry Wolfgang, WR1B, Photo]

Almost 150 aficionados of digital communications came to Chicago for the 27th annual ARRL/TAPR Digital Communications Conference (DCC) the weekend of September 26-28. This conference is an international forum for radio amateurs to meet, publish their work and present new ideas and techniques. Presenters and attendees had the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. Not only was the conference technically stimulating, it was a weekend of fun for all who have more than a casual interest in any aspect of amateur digital electronics and communications; introductory sessions were scheduled throughout the conference to introduce new technical topics for both beginners and experts.

One of the attendees was QEX Editor Larry Wolfgang, WR1B, representing the ARRL. He gave a talk "Writing for Publication - It's Not Rocket Science (Even if You Are Writing About Rocket Science!)." Retired ARRL Chief Technology Officer Paul Rinaldo, W4RI, also represented the League, speaking on "SDR Outlook." Central Division Vice Director Howard Huntington, K9KM was present, as was ARRL Contributing Editor H. Ward Silver, N0AX.

Wolfgang gave his presentation on Friday morning and said he talked with many participants throughout the conference who told him that he had them enthused about writing something for QEX. "It also seemed like almost everyone there was making a point to stop me in the hallways or at mealtimes to tell me how much they are enjoying QEX, and to thank me for the effort I putting into the magazine," he said.

Friday was a full day of technical presentations, including "A Protocol for Multicast Weather Data Distribution over AX25," by Nick Luther, K9NL; "SuitSat-2 Update," by Steve Bible, N7HPR; "EcomScs and GateWayScs AX25 Packet Radio E-Mail," by John Blowsky, KB2SCS, and "Frequency and Other New Initiatives in APRS," by Bob Bruninga, WB4APR. The last presentation of the afternoon was "D-STAR Uncovered," by Peter Loveall, AE5PL.

The DCC provided a separate demonstration room for participants to bring and show off their latest projects. Participants were encouraged to bring their own equipment and display for all to see and learn. Wolfgang said he had some "play time" in this room after all the presentations on Friday. After dinner that evening, he said there was "a string of D-STAR presentations starting at 7 PM and lasting until after 10 PM. These were all very interesting presentations, including the D-RATS messaging software by Dan Smith, KK7DS.

Peter Loveall, AE5PL, presented "D-PRS Update" about ways the D-STAR data links can be used to send and plot APRS position maps or interface to the APRS system. Robin Cutshaw, AA4RC, gave a presentation about DV-Dongle, a PC add-on that allows connection to D-STAR repeaters around the world through your PC and an Internet connection. Pretty interesting!"

In addition to the main technical presentations on Saturday, there was also a full day of introductory sessions, mostly about digital voice and D-STAR.

Also on Saturday, Matt Etttus, N2MJI, gave a report on the Ettus Research USRP2. Tom Clark, K3IO, gave an "AMSAT Update." Paul Wiedemeier, KE5LKY, presented his paper on "Using UDPcast to IP Multicast Data over Packet Radio." Paul Rinaldo, W4RI, gave his "SDR Outlook" that covered the international regulatory front and presented some of the concerns that some world governments have with regard to the flexibility of SDR. Scott Cowling, WA2DFI, gave an "HPSDR (High Performance Software Defined Radio) Update" during which he described the various circuit boards that make up the HPSDR project. He also demonstrated a complete working radio in the demo room. Jerry Shirar, N9XR, presented a paper called "Clocking the Data," concerning the use of an inverter and a crystal to form a Colpitts oscillator.

Victor Poor, W5SMM, gave an update on Winlink 2000. "He reported that there is one Web site, five Common Message Server sites around the world, 150 Radio Message Service Pactor Gateway sites, 800 RMS Packet Gateway sites and over 13,000 registered users," Wolfgang said. "He also mentioned that inactive users are purged from the system from time to time." Rick Muething, KN6KB, described his "WINMOR Soundcard ARQ Mode for Winlink HF Digital Messaging." Wolfgang said that this was a much anticipated presentation: "Rick reported that WINMOR is 3 to 4 months from beta testing. His preliminary comparisons to Pactor 1, 2 and 3 use a simulator. He indicates that WINMOR will have better throughput than Pactor 1 and comparable to, or perhaps a bit better than Pactor 2, but not quite as good as Pactor 3. He indicated that the efficiency is within about 70 percent of Pactor ARQ."

The TAPR Annual Meeting was held after all the presentations on Saturday where the Board of Directors discussed the idea of coming back to the same hotel for next year's DCC. "The local group that supported DCC this year, including Mark Thompson, WB9QZB, and Kermit Carlson, W9XA, did a great job of providing AV support," Wolfgang said. "Ron Steinberg, K9IKZ, who owns a local audio/visual company, provided two large projection screens and projectors, so every presentation was shown on both sides of the room, as well as on a widescreen TV outside the room. The audio was very easy to hear, even if you were in the hall outside the room or in the demonstration room; the set-up was left there from the W9DXCC Convention the previous weekend. They offered to provide the same support for next year, if the DCC returned. So, the decision was made to break with tradition, and return to Chicago next year, September 25-27."

Phil Harman, VK6APH, presented the Sunday morning seminar, "Software Defined Radio Through the Looking Glass." Wolfgang said he found Harman's presentation to be understandable "at my level of knowledge, and he gave a lot of good insight into many of the design decisions that went into the High Performance Software Defined Radio Project. I found his descriptions of how the hardware and software work to be very interesting. The four hours went by quickly."

For more information on the 2008 Digital Communications Conference, please visit TAPR's DCC Web page.

5565. Magnetic North or True North?

Yahoo group: APRS (2007 — 2010)
Date: 2008-10-08 04:02:17 UTC
From: Rod Bartlett
Topic: 5565 Message: 5565

What setting should I be using in my GPS. I have the datum set to WGS84, but DB0ANF shows me on the wrong side of the street. The GPS shows it is accurate to 14 feet, but the maps keep showing me about 100 feet east of my actual position. If I am traveling E-W, it shows me right on the road. If I am traveling N-S, it shows me to the east of the road. I am assuming the problem is with my GPS settings. If you look at the map below, it has me on the wrong side of the road.
http://www.db0anf.de/app/aprs/stations/googlemap-N8QVR-8

Thanks

Rod - N8QVR

>WGS84, but DB0ANF shows me on the wrong side of the street.

You must combine the in-accuracy of the GPS and the in-accuracy of the
map. 100 feet is 32 meters. That's within the normal fluctuation of
consumer grade GPSes without correction from dGPS/WAAS/EGNOS.

My old Kenwood 241 finally died...this time, for good it appears. many years ago, I went inside, and took the audio off the discriminator, and the mic output, and ran them out the back to a DB-9 connector for APRS (packet) operation to the TNC.

This was nice, because I could leave the mic plugged in all the time, and, hear the packets by turning up the volume.

My question is this...short of a full blown APRS radio, does anybody know of any radio that can do this off the shelf?

Thanks, and 73.

-Chris

Yaesu FT-2600
It has a DB-9 on the back of it, 60w 2m radio.

I have one that has been in service for over 4 years now, it is wired to a TT2 and an E-Trex.
http://www.kb7tbt.com/pix/aprspix/ Photos are 3 years old but you will get the idea.

If you would like to read the user manual you will find that on my manuals page at:

Would work perfectly, but its discontinued, and its replacement does not offer a data connection.

Been looking at the Alinco DR-135, but Im not a fan of Alincos.

I use True North and don't have that problem.
Also, believe maps are made using True North. (Survey)

You might look at the Kenwood D700 and D710. I know the 700 has a data connector and I suspect the 710 does also.

Yes, the Kenwood D-710A does have a dta connector and it's one HONEY of a radio! And I thought the D-700A was cool (it still is). The features of the '710 are worth the extra price!!

I was not sure if it was discontinued or not, but I wasn't really concerned with that. You could prob find the 2600 at a hamfest or eBay cheep.

The Alinco is a good radio, I have had plenty of them and I currently have the 635 and a 235 as my house radio. My 605 went thru hell with me for 7 years until the day it started messing up, I just gave it away and replaced it.

For the simple APRS shelf radio I would agree with the 135, you can also get a T2-135 board from Argent Data Systems.

Hey,
Anyone around here using a TH-D7A(G)or something else that is portable?? Looking to find one so that I can be totally APRS accessible around here. Currently, run UI-VIEW32 in the shack, D710A in the mobile and now want portable. So, does anyone have a TH-D7A they are looking to depart with for maybe saving for the VX-8R?? Or just want to update their HT's?? Let me know...

I've seen two people post with TH-D7A's for sale in the last week on
TAPR's ARPSSIG list.

5581. Grouply spam -- Steps needed to protect your privacy

Yahoo group: APRS (2007 — 2010)
Date: 2008-10-10 06:06:09 UTC
From: w6dtw
Topic: 5581 Message: 5581

clarse19@... (a member of this Yahoo Group) has signed up for Grouply. This is a group-content aggregation service which uses the member's access to obtain content from the group(s). You can read an article on Grouply here:

http://mediaconcepts.blogspot.com/2008/02/is-grouply-spamming-and-phishing-you.html

Grouply then uses the member's access to send spam to other group members inviting them to become a "friend" on Grouply. This happened in the Yaesu-Radios group a couple of months ago.

The only way to stop this is for the moderators of this group to opt-out of Grouply. It's not necessary for the moderators to register with Grouply to do this. Instructions for opt'ing-out of Grouply are here:

http://tech.groups.yahoo.com/group/GrouplyImprovements/message/478

I strongly encourage the moderators of this group to take steps to secure our privacy by opt'ing-out of Grouply.

There is one other step that group owners/moderators can take in addition to opting out of the Grouply phishing/spamming system.

They can do what I also do:

Ban the Yahoo ID and email address of each new Grouply Spammer immediately whenever you see one in ANY group, regardless of whether that individual is or isn't already a member of the groups you own or moderate.

http://www.abqjournal.com/abqnews/index.php?option=com_content&task=view&id=8997&Itemid=2

One dead, one critically injured after 'Wings of Wind' balloon crashes into powerline near N.M. 528.
The two people who were aboard the "Wings of Wind" hot-air balloon when it crashed this morning have been identified by Kathie Leyendecker, a spokeswoman for the Albuquerque International Balloon Fiesta, according to The Associated Press.

Killed in the crash was Stephen Lachendro, and the balloon's creator, Keith Sproul, was critically injured in the accident, Leyendecker said.

Leyendecker said she did not know where the victims were from, nor who was flying the balloon. The balloon was registered to a New Jersey pilot, she told the AP.

Lachendro was found dead at the scene lying on the side of a ditch, Sproul was unconscious and was flown by helicopter to a local hospital, authorities said. A hospital spokesman said Sproul was in critical condition today afternoon, the AP reported.

Ron Swart

5587. I-Gate passing garbage

Yahoo group: APRS (2007 — 2010)
Date: 2008-10-14 10:11:41 UTC
From: jdmcomm
Topic: 5587 Message: 5587

Hello Group,
I have an I-gate in my area connected to rotate.aprs.net and receiving on 144.390 that continuously is passing false callsigns into the network.

The station receives off just a small antenna outside a window but gates stations that are usually digipeated through a digi on a broadcast tower.

By false callsigns, for example, I am running a mobile station of N4DBM-7 and N4DBM-9. On Find-U, stations like "PN4DBM-7" "N4DBM-J" "M4DBM-7" "NWDBM-7" and other variations are popping up.. I thought it may be something wrong with my mobile sending garbage, but when I look at the raw data, ONLY the false callsigns are coming through this certain I-Gate.

I have begun to notice many other stations around with different first letters, or a missing piece of the callsign that it's obvious it's just a misprint.

I have asked the owner if his "passall" command is OFF. He says yes. He tells me me thinks the problem is coming from the local digipeater, but yet no one else's I-Gate is passing garbage.

Anyone have any ideas? The I-gate operator is cooperative and wants to know an answer as well. He is running Ui-View 32. Thanks, N4DBM.

> to know an answer as well. He is running Ui-View 32. Thanks, N4DBM.

This has happened numerous times over the years here in the Seattle area. We just had a UI-View station doing it a couple of weeks back, but this is by no means a UI-View specific problem.

It can be:

1) "Passall" or what we call garbage mode enabled on a TNC somewhere (doesn't have to be the igate).
2) USB->Serial adapters on the igate.
3) Serial port interrupts that aren't getting serviced fast enough on a PC.
4) A TNC with it's memory buffers full.
5) Bugs in the igate software.
6) Design flaws in the TNC hardware or firmware.

Regarding #3 above: It can be caused by:

1) An underpowered PC.
2) Too many apps on the PC slowing it down.
3) PC out of memory or swapping too heavily.
4) Too high of a baud rate between the TNC and the PC.

Some TNC's have trouble at high baud rates due to their design, sometimes having to do with an op-amp used to generate RS-232 in the TNC that doesn't have a high enough slew rate to do the higher rates.

That should give you a few things to think about. I might even come up with another one or two.

I've been collecting APRS-IS data in a rotation 7 day window for North America. If you can give me the callsign of the IGate in question, I may be able to provide a list of all packets gated by that gate for any time range in that window. You can send me the callsign directly if a modicum of anonymity is desired.

Tracker-only, or two-way APRS?

The answer is yes to both though.

You can add APRS to any FM voice radio that has connectors. All
radios I know of have a MIC and an external speaker connector which
is all you need (1200-baud APRS).

For 9600 baud APRS you often need to solder directly into the
discriminator and into the varactor to do so.

If you want an all-in-one unit (except for the GPS) without extra
cables and units, your options are quite limited. If you don't mind
having an external TNC and data/power cables going to the radio,
then you have several options.

Because of dupe checking, it is possible that other IGates see the same mangled packets but only his IGate is getting to findU first. However, a simple look at his TNC window (I believe UI-View has this capability) should show whether he is seeing these from his TNC. If the TNC is in command mode (not KISS mode), it is possible to monitor the TNC directly using something like Hyperterminal. If the TNC is in command mode and everything looks ok to a terminal program, it is quite possible that there is something in the TNC settings that UI-View doesn't like.

If the TNC is in KISS mode, determine what "flavor" of TNC it is. This type of mangling should not occur in KISS mode, but...

Finally, compare what he is receiving with what another TNC is receiving. Don't rely on single point observations (or assumed observations by remote IGates) to focus on a single culprit. If you are using a D700/D710, disconnect your GPS and place the radio in P.Mode if you don't want to hook a PC to your radio. This will show you the same packets that your friend's IGate is receiving.

Hope this helps.

Ron,

Yes - you can use the 8900 for APRS - all you need is a TNC and a GPS - and all the right cables.

I've used TT3's, OpenTracker and a KPC3 with my radios, including VX5, VX7, 8100 and 8900.

Specifically the 8900 (and most Yaesu mobile radios) have a data connector which means you don't need to use the speaker and mic jacks for APRS. This is valuable because it allows you to continue to use one side of the radio for voice and the other side for APRS. Of course, for the APRS to work (i.e. TX) - that side of the radio has to be active - or you'll be transmitting your APRS packets over your voice frequency.

You'll also need a GPS unit of some kind. Here you have several choices - but the unit has to have NMEA-0183 out in order to work. Many of the (older) GPS mobile units (Garmin, et. al.) have this, but most newer units do not. The basic eTrex units do as well as the 60CS series. Also - you can get dedicated GPS units ("hockey pucks") - they look like GPS antennas, but are actually fully functional GPS's - just no display. Garmin GPS18 as well as Byonics and Argent Data are sources for these latter ones.

The key for all of this is getting the right cables. Argent Data and Byonics both sell some cables and there are other sites that have an even great selection of cables.

And, yes, the radio can be "2 Way APRS" - assuming you have the proper TNC - i.e. TT4, OpenTracker + or a generic TNC (KPC3 etc.)

Hope this helps.... Good luck,

5 on 5 off...they kinda did away with that sort of split break years ago..can only stop your 14 hour clock with 8 continuous hours on line 2. Or are you under the 100 airmile rule?

Personally I use a garmin gps17 mounted to my lhs west coast mirror (from www.wmjmarine.com), an ft7800r, and an elcom musbtnt+ (www.elcom.gr). It operates as a dumb tracker when I'm driving and I plug it into my laptop running xastir when I'm parked. Running 26,000+ miles a month, there's not a lot of parked though...10 on 10 off with my students. I've yet to have anything get the gps to lose fix other than the kittatinny mountain tunnel. I built the cables and junction box doodad myself but I'm pretty sure Elcom has 'em premade.

Also wilson antennas makes an nmo mount with the cable terminated in fme...get a vhf-fme adapter and hey now you can drill a little hole instead of sandwiching the cable through the weatherstripping. Lousy idea if you slipseat but very workable for us O/Os.

From: Beckwith, John C.
Topic: 5586 Message: 5598

Ron,

A couple of interesting (and not necessarily easy) questions, but I'll give it a shot.... I'm sure others can chime in with better ideas....:-)

You can certainly build a very portable solution (Byonics has an all-in-one unit) - but that assumes antennas attached to or nearby the rest of the package. In a semi that may not be sufficient. You may also be limited in power. I have an HT attached to a OpenTracker and a hockey puck that is very portable, but may not work in your situation. Plus power is limited to the HT's 5w.

So the problem of portability is primarily one of antennas - both GPS and Radio. This is the part that will make portability a little more difficult. One of the simple answers to portability for a ham radio, of course, is a mag mount antenna. If you have the right connectors - you could have a TNC connected to the radio and then have a mag mount antenna for the radio and a hockey puck GPS (which has a magnetic base) and that would do the trick. Of course, you also need power for all this and it's always recommended that you have power cables connected directly to the battery with fuses on both power and ground. Using a "cigarette lighter" outlet is always discouraged - if for no other reason it's fuse/power handling may be too low.

If I was doing what you're asking - I suppose I'd go with the 8900 (though there are cheaper alternatives if you don't need 10m and 6m) - I'd attach a TT3+ (TT4 for two way) or OpenTracker to the 8900 data jack. And then a hockey puck GPS to the other side of the TNC. With a long enough cable the GPS could go on the roof - or at least some area open to the sky. Then the ham radio antenna using a mag mount. With this setup it wouldn't take too long to put it in and take it out of each rig.

I have found both companies (Byonics and Argent Data) to be helpful and responsive - and also found both their products to be good and suitable to the task. I would avoid a generic TNC for you purposes - too complicated by far. So don't hesitate to contact them for help on this project as well.

The 2 way APRS mentioned previously allows you to plot other stations, but you need a display to do that. Some Kenwoods actually will do that for you, but most of us use PC's for the display of other units. If you're not interested in displaying other units, only beaconing your position - the TT3+ will do the job - as will the OpenTracker+

The dedicated GPS units can be found on both Byonics and Argent Data websites. Once you decide which TNC to buy - you can just get the GPS from the same source as well. At this point I'd go with a GPS that has the newer SiRF III Chip - available from both companies. The SiRF III chip is much more sensitive and has quicker acquisition time than the older models. Most of us can get satellite locks inside our houses with these models. And would be a good choice for inside your rig - though with all that metal....????....:-)

So - to summarize - you would have a radio (8900, 8800 etc.) with a mag mount antenna. Connected to the data port of the radio would be a cable that would connect to one side of the TT3+ or OT+. On the other side of the TT3+ or OT+ would be the cable to the GPS unit. Then you'd need power to both the radio and the TNC. (A 9v battery will run the TNC for a long time, but you can also use the same 12v (regulated) source as the radio.

Again - good luck,

John Beckwith, N6JCB

Doesn't look like it - It doesn't list NMEA 0183 output anywhere. USB outputs never work with TNC's - only computers.

Typically NMEA outputs are serial (in protocol) and are generally some kind of proprietary connector - at least with the Garmin's. So, if you see some kind of weird connector on a Garmin unit (not USB or external antenna) - there's a chance it'll be a serial NMEA output.

Again - most new units do not come with NMEA output - sadly.....

Yes, to a limited extent. So far my Tracker2 is the only APRS device that'll talk to a c340. I've got a protocol translator cable in the works that'll let it talk to a D700. However, I'm not sure the c340 is able to plot waypoints. It'll provide position data, though, and if you're using the Tracker2 it'll also do text messaging.

From: Scott Miller
Topic: 5600 Message: 5603

The newer StreetPilot and nuvi models have a 'hidden' serial mode that
works through the USB connector. Put an 8.2k resistor across the right
pins and it'll speak a variant of the old Garmin asynchronous binary
protocol at 9600 baud. No NMEA, but my translator cable takes care of that.

The USB portion of the cable assemblies is done and they should ship
from China this week. I'm still waiting to hear back from another
vendor to find out if they'll be able to pre-program the MCUs for me or
if I'm going to have to machine a fixture to do in-circuit programming.
The PCBs are ready, though, and I've successfully built a few samples
- but it's a laborious process to manually solder a 7mm 48QFN package
onto a tiny board and program it without a fixture.

Which reminds me, it's time to order some more Delrin stock in case I do
need to fabricate something...

I stand corrected.

Scott - can you clarify your "protocol translator cable" a little???

Thanks,

Yes, to a limited extent. So far my Tracker2 is the only APRS device that'll talk to a c340. I've got a protocol translator cable in the works that'll let it talk to a D700. However, I'm not sure the c340 is able to plot waypoints. It'll provide position data, though, and if you're using the Tracker2 it'll also do text messaging.

A lot of people run one-way trackers. They're transmit-only setups
where if the system is capable of receiving it's only being used to
avoid stepping on others on the channel. In this case others can
see where you are but you can't see where others are. No messaging
capability in either direction.

Other people run systems that can plot others' locations on a PDA,
laptop, or their GPS map screen. Some of these are also capable of
two-way messaging, sending one-liners back and forth across the air.

The D710A mobile rig + GPS can do all of this. So can an Alinco
DR-135T with a T2-135 board in it and a Garmin Nuvi 350 GPS. So can
a HamHUD + TNC + radio + GPS.

For the smallest number of items that you'd have to lash together,
these would be the best:

Kenwood D710A + GPS
Alinco DR-135T + T2-135 board + Garmin Nuvi 350

Each of these configuration would be just two units, the radio unit
and the GPS. Any of the other configurations require more hardware.

You could also buy just the TNC portion of the D710A (Don't remember
the number) and lash it to the radio you're thinking about, but then
you'd still need a GPS as well making three units total. I believe
you'd be able to do 2-way messaging with that scheme too. The least
expensive option is the Alinco/T2-135/Nuvi 350.

If you really want that Yaesu then connect up a Tracker2 TNC for
something like $85 and a Garmin NUVI 350 for something like $179
right now, plus a few cables, and you have 2-way messaging, mapping
of others, tracking, the whole shebang, in three parts instead of
two. If you don't care about messaging you can get a different GPS.
If you just want tracking then buy an OpenTracker+ instead and a
hocky-puck GPS and save yourself some money. That last is basically
what I'm running now.

Buy an ammo-can and mount it all in there. Run the radio in the 20W range instead of low power or high power. Plug into the cigarette lighter cable or better yet have a way to tie directly into the battery. Fuse both the power and ground leads on the power source end of your cables. Strap the ammo-can under your seat and throw a mag-mount 1/4 wave antenna on top of the truck, center of the roof.

When you want to move it, wrap all the cords around and around the ammo can and then slap the mag-mount antenna on the top or side of the can where it'll stick nicely. A very portable setup.

A lot of radios also leave the MIC active while transmitting APRS.
Just a warning. Best to unplug the MIC if running it as an APRS
rig, unless you have a dual transmit/receive rig where you can
specify which side of the radio the MIC is active on.

It's got a USB mini-B connector on one end (I'll eventually have an
18-pin connector option) and a 2.5mm stereo plug on the other (for the
D7/D700/D710, DB9 will be an option later) with a small circuit board
inline containing a microcontroller with a couple thousand lines of code
that translates the Garmin PVT format to GPGGA/GPRMC and translates
GPWPL and PKWDWPL strings from the radio to Garmin waypoints.

Here's a picture of it in operation:

http://n1vg.net/images/nuvi_d7.jpg

And one of the prototypes:

From: Mark Thompson
Topic: 5609 Message: 5609

-----Original Message-----
From: ARRL Web site <memberlist@...>
Sent: Tue, 14 Oct 2008 12:47 pm
Subject: Preview the 2008 ARRL On-Line Auction NOW!

PREVIEW WEEK STARTS OCTOBER 16, AT 10AM ET
?
Just what is preview week? You have an entire week before bidding starts to register to bid, and browse through new equipment, vintage equipment, and products?& services. You can also tour our virtual Flea Market category from the comfort of your chair and check out the many bargains.
?
PLEASE NOTE THAT YOUR PASSWORDS AND USER IDS FOR THE ARRL WEB-SITE ARE NOT TRANSFERABLE TO THE ARRL ON-LINE AUCTION WEBSITE. YOU WILL NEED TO REGISTER HERE IN ORDER TO BID: www.arrl.org/auction
?

The 2008 ARRL On-Line Auction
will open for bidding on October 23rdat 10AM ET.
?
Bidders will be treated to over 160 items to browse through and bid on, including a vast array of QST Product Review items, new and pre-owned equipment and other goods and services.
?
Proceeds from our yearly On-Line Auction benefit ARRL education programs including activities to license new hams, strengthen Amateur Radio's emergency service training, offer continuing technical and operating education, as well as creating instructional materials.
?
This event would not be possible without the generosity of our donors. Our sincere thanks to all who donated items for this year's auction and a special mention to the two organizations below who have chosen the highest level of participation as 2008 ARRL On-Line Auction Golden Gavel Sponsors.
?
??
Golden Gavel Sponsor?- Icom America, Inc.?donates the?IC-7000
?
The ICOM IC-7000 represents the next generation in all-mode HF/VHF/UHF mobile transceivers. DSP at the IF level is the cornerstone of this impressive new multi-bander. In fact, the 7000 employs two DSP chips to work its magic. Imagine having 41 bandwidths available - standard! You can even select sharp or soft filter shape. And variable twin PBT allows you to either narrow the IF passband, or shift the entire passband to eliminate QRM. All the controls are intuitive to use.
?

Eight of the most-used radio functions are controlled by dedicated function keys grouped around the display for easy visibility. One quick touch turns the function on and off. A longer touch activates adjustment of the function's setting. An internal memory keyer provides four memories for station information or contest exchanges. The keyer also performs automatic repeat, automatic contest serial numbers and cut-numbers. The Digital Voice Recorder (DVR) function has a front panel REC control that allows you to record incoming signals for up to 25 minutes.
?
Other features include: a detachable control head (requires optional separation cable), 503 memories, S/PWR/SWR meter, RIT, Preamp, RTTY Demodulator, Attenuator, adjustable SSB bandwidth, NTSC video output, DTMF memory, VOX, full break-in and adjustable CW pitch.
?
The IC-7000 comes with the HM-151 backlit remote mic, spare fuses, key plug and DC power cable.
?
Please click the ICOM??link HERE for more information.
?

< /div>
Golden Gavel Sponsor?- R4 Systems, Inc. donates the PROTEUS DESIGN SUITE from Labcenter
?
Proteus PCB design combines the ISIS schematic capture and ARES PCB layout programs to provide a powerful, integrated and easy to use suite of tools for professional?printed circuit board?design.
?
All Proteus PCB design products include an integrated shape based autorouter and a basic SPICE simulation capability as standard. More advanced routing modes are included in Proteus PCB Design20Level 2. The Advanced Simulation Feature (ASF) option is also included in this package.
?
The following are some of the Proteus highlights:
* Full feature ISIS schematic capture with support for hierarchical design, bus pins, configurable bill of materials.
* Netlist based ARES PCB layout with support of up to 16 copper layers, 10nm resolution, any angle component placement, full electrical and physical design rule.
* Basic Simulation.
* Unlimited Shape-based Power Planes.
* Global Shape Based Autorouting.
* Command Driven Interactive Autorouting.
* 3D Board Visualization.
* Gerber standard output files.
* ODB++ Manufacturing Output.
* Gate-Swap Optimizer.
* Board Auto-placement.
This Proteus package gives the electronics designer all the tools necessary for Concept to PCB layout in a easy to use package.It includes Schematic capture, Advanced Simulation, PCB Layout, Shape-Based Autorouting for the most demanding of boards.?Proteus is the CAD package every HAM would like to own. A copy of our Free Demo can be downloaded at our website.=0 D

If to be used in a car and see other stations, you'd need not a
tracker, but a TNC and a GPS with map display and two-way NMEA
communication. To be able to send messages (when parked or being
passenger, of course), you also need a computer with software to
communicate with the TNC; a dedicated APRS software is recommended.
(Or, an APRS radio, of course)

The Tracker2 with a nuvi or StreetPilot will do two-way messaging without a PC. The nuvi 350 works best so far. A T2-135 board, DR-135T radio, and nuvi 350 should be around $450 total right now.

The 350 is still available (and a bargain right now) through Amazon.com,
Wal-Mart, and others. But yeah, it's at the end of its life cycle.

No other model tested so far does waypoint display without duplicates.
Garmin is supposed to have some changes in the works (maybe only for new
models, who knows) that will address some of the deficiencies.

Buy an ammo-can and mount it all in there. Run the radio in the 20W range instead of low power or high power. Plug into the cigarette lighter cable or better yet have a way to tie directly into the

battery. Fuse both the power and ground leads on the power source end of your cables. Strap the ammo-can under your seat and throw a mag-mount 1/4 wave antenna on top of the truck, center of the roof.

When you want to move it, wrap all the cords around and around the ammo can and then slap the mag-mount antenna on the top or side of the can where it'll stick nicely. A very portable setup.

I used to run tanker truck for 10 years, so I know. :-)

If you have a sleeper cab, what you can do is to get a large square of galvanized sheet metal and a tube of RTV and glue the sheet metal down on the sleeper. That would give you an effective ground plane for the mag-mount to work against.

You have no brackets on the roof anywhere? I run a daycab and on the occasion (Being a cornbinder, it's more often than I care) that the truck goes down for service I run a mag and stick it on an airdam bracket. The permanent install is simply a CB antenna mirror mount bored out to accept an NMO. Works fine.

Probably HRO for that nmo mount, the pelican case and a ciggy lighter plug for radio and gps power, any 2m nmo antenna, and your vice grip mount. I've been using a diamond cr320anmo for like 3 years and I love it..

Thinking..if you're just doing aprs why not make your own stud mount antenna? 18.5 inches of 1/4" stainless rod with a base like what you find on the bottom of a cb antenna..makes finding replacement parts really easy. Or find an old stainless cb whip and chop it down even. Larger diameter wire/rod means tuneability over a wider freq range..kinda makes me wonder how an antenna with the aspect ratio of a tuna can would work. Gotta try that sometime.

Might even commandeer one of the existing cable runs for the cophased cb antennas?

I'm on myspace.com/danbowkley....the background is my old truck, new rig is buried in there someplace.

Dan

Some of those co-phased CB setups use 75-ohm coax which you'd want
to stay away from. Weird but true. I had a setup like that back in
the 70's on the farm truck, "Hustler" brand as I recall.

Hi;
Just a thought - if you share this truck and don't drive other trucks,
why not do a more permanent installation and leave it running 24/7?

You may or may not want to explain everything you've done to the other
driver. He may see the benefit of having the permanent installation.

I have a HTC P3600i PDA phone with built-in NMEA GPS output with USB connector(no host).-running TomTom
Is it possible to get APRS positions onto the PDA?
I have looked quickly at APRS CE but the descriptions don't tell me much.
Maybe I can I port D700 tnc data to it somehow or should I use the OT1+ (which I have spare) with the PDA with a second radio and keep them seperate?

Cheers
Glenn, vk1nut

Look up HRO in the antenna mount section and look for a mirror mount by Iron horse. That's what I use. From one trucker to another.

Mailer: Thunderbird 2.0.0.17 (Windows/20080914)

It's got a USB mini-B connector on one end (I'll eventually have an 18-pin connector option) and a 2.5mm stereo plug on the other (for the D7/D700/D710, DB9 will be an option later) with a small circuit board inline containing a microcontroller with a couple thousand lines of code
that translates the Garmin PVT format to GPGGA/GPRMC and translates GPWPL and PKWDWPL strings from the radio to Garmin waypoints.

Here's a picture of it in operation:

http://n1vg.net/images/nuvi_d7.jpg

And one of the prototypes:

5632. I-Gate false data & USB adapter

Yahoo group: APRS (2007 — 2010)
Date: 2008-10-17 00:03:51 UTC
From: jdmcomm
Topic: 5632 Message: 5632

The I-Gate station passing bogus callsigns IS using a USB to serial adapter. Evidently he doesn't have any other way to connect the TNC. Would lowering the baud rate down to say, 2400 baud, from the TNC to the computer help anything?

It might. They could go all the way down to 1200 baud in fact and
still keep up with on-the-air traffic (assuming they're on 144.39
and not a 9600 baud channel).

It kind'a depends on whether the data is getting scrambled by the
TNC, by the serial cable/adapter, or by the computer.

Sorry this is late going out. The outgoing mail wasn't being accepted the day I wrote it, so I put it in my postponed mail folder and just found it.

On Tue, 14 Oct 2008, Rondall Swart wrote:

> i dont mind extra cables, from what i'm looking more at tinytrak4
> to add to a radio as soon as i buy my mobile unit.

If you want 2-way APRS messaging you can go one of these routes for a mobile:

Kenwood D710A + GPS
Alinco DR-135T + T2-135 TNC + Garmin Nuvi 350 GPS
Any mobile radio + HamHUD + Tracker2 TNC + GPS
Any mobile Radio + TNC + laptop + GPS

I'm partial to the OpenTracker TNC's over the TinyTrak's 'cuz Scott's stuff is open-source. I've used both types though and they both put out good products.

The TNC that is probably most used in APRS is the Kantronics KPC-3+ but it's a bit expensive. The Tracker2 is less than half the cost and pretty much as capable.

The Alinco DR-135T can accept the OpenTracker T2-135 TNC board internally in place of the TNC you'd buy from Alinco. The Alinco TNC comes with the DR-135TP version, whatever you do _don't_ get that one, get the Tracker2 version instead. Combined with the Garmin Nuvi 350 you can do 2-way messaging on the GPS itself, plus see where other people are on the GPS and of course send your own position and even digipeat others if you wish. Just two boxes to install in the mobile that way, but I think you might need separate power and data cables for the GPS, two different connectors on the unit I think.

Oh yea, Kenwood also sells the separate TNC box that the D710A uses, and it can be connected up to any other radio to give you APRS. That might be a bit of an expensive direction to go but it's another option.

FWIW I'm running one 2-meter voice radio and a separate 2-meter radio for APRS while mobile, with an OpenTracker and a puck-type GPS. This gives me a transmit-only APRS setup. I have some Tracker2's and will swap the OpenTracker with one of those soon. When the APRS radio transmits the voice rig gets desensed, but I'm running Base-91 compressed packets so they're short and the

interruption to my voice operations is short. Once I swap the TNC
I'll be able to sometimes throw in one of my other GPS'es when I
want to see where others are, or a NUVI 350 someday if I also want
to do 2-way messaging. It'll also let me do digipeating or let me
hook up a laptop for full APRS capability on occasion (Xastir, yea!).

It can be run on Windows through a variety of methods, but no, it's
not a native Windows program.

See the Xastir Documentation link, then Installation Notes. It
gives you three options for getting it going on Windows. The VMWare
image is the easiest.

How long ago? Linux has changed a bit in the last 15 years. Most
of the installs are quite graphical now, requiring little at the
command line.

Many of the Xastir new-to-Linux users have tried Ubuntu and are
happy with it.

I'm one of the Xastir developers and currently run
OpenSuSE-11.0. So do my kids.

Both Ubuntu and OpenSuSE are free downloads.

5643. aprs vs D-star?

Yahoo group: APRS (2007 — 2010)
Date: 2008-10-20 03:07:11 UTC
From: Shawn
Topic: 5643 Message: 5643

Is there any interface for D-star to aprs and vise versa? I realy have no idea how Dstar works but from what I've read about it, is they have done something similar to aprs. The aprs-like feature is the only thing I wood interested in as the others that Dstar has there aren't any repeaters around here for and I'd only be interested in it if there was an interface to aprs.
Thanks
Shawn

D-STAR is a completely different transmission medium from the analog medium that is used for APRS. D-STAR digital voice (DV) found in the VHF and UHF Icom radios is a digital streaming protocol designed for carrying voice information. It is not, in any way, compatible with the AX.25 packet protocol (APRS uses this on RF).

The D-STAR protocol does have the capability of simultaneously transmitting very low speed data -embedded- with the voice bit stream and Icom radios can transmit GPS information while the radio is keyed down. There is the ability to translate this information to APRS (see www.aprs-is.net for more information on D-PRS) but it should not be construed as a bidirectional D-STAR/APRS interface as the protocols are completely disparate.

If you are looking for an APRS radio, D-STAR is not your answer. If you are looking to participate in the D-STAR digital voice world and be seen in the APRS world, then D-STAR is a good solution. From your post, I would say that you are not looking for a D-STAR solution at this time.

Hope this helps.

73,

Pete AE5PL

Here you can see more about D-STAR.
Basically is a data and voice transmision system, with D-STAR you can do the same with "ECHOLINK" but without a PC, using only a D-STAR tranceiver through D-STAR repeater.

5648. D-STAR VS APRS

Yahoo group: APRS (2007 — 2010)
Date: 2008-10-20 23:23:24 UTC
From: Ted Banks
Topic: 5648 Message: 5648

D-star does not seem to be very popular for some reason in my area, no repeaters very close.

5649. Embedded Linksys WRT54G I-Gate / Digipeater on the cheap!

Yahoo group: APRS (2007 — 2010)
Date: 2008-10-21 06:48:40 UTC
From: preston_b_moore
Topic: 5649 Message: 5649

If your looking for a really cheap I-gate package you can't go wrong with APRS4r software. I loaded it on a T-Mobile branded Linksys WRT54G-TM router and it appears to do everything I need. If there is any interest I can write up a "how to" to get you going.

What I used:

Linksys WRT54G-TM wireless router

The classic "blue face" router, but this one is branded by T-Mobile. The router is available at any T-Mobile store for $29.99 and does not require a T-Mobile account to purchase. The T-Mobile version for the WRT54G has 8mb of flash ram and 32m of memory. This is important!

Argent Data Systems OpenTracker+

OpenTracker+ kit for $32 and running the KISS firmware.

Serial port kit for the WRT54G-TM:

You are going to have to add serial ports to the 54G. This can be done very cheap with a few capacitors and MAX232 chip. I have made several serial port converters for 54G routers, but recently found a kit that makes this very easy. Check out:

http://curiousinventor.com/kits/spk_wrt
(VERY fast shipping and very easy to install)

I am using an Icom IC-V8000 radio, but obviously any radio will work. You will also need a null modem cable to connect the OT+ to the 54G.

http://www.burnsranch.org/aprs/

APRS4R has a built in tracking program using GoogleMaps:

http://prestonmoore.com:8085/aprs4web/aprs4web.html

If anyone needs help configuring let me know. The APRS4R software is mostly in German, so it can be a little confusing.

5650. UI-View 32 and precision maps 8.0

Yahoo group: APRS (2007 — 2010)
Date: 2008-10-21 12:27:51 UTC
From: Dave
Topic: 5650 Message: 5650

I just loaded up precision maps 8.0 onto my laptop for use with
UI-View 32 and cannot figure out how to get UI-View to use those maps
for those maps.
The instructions on the UI View website said to open the control panel
from the "map" menu but I don't see it and the help menu isn't helping.

You should go to wa8lmf's pages.

For support for UI-View, the UI-View group is recommended.

||Precision Mapping version 8 works with UI-View32; the necessary additional PMapServer7
is
||available for download at <http://www.ui-view.org>.
||At <http://wa8lmf.net/aprs/UIview_Notes.htm>, you will find useful hints and info for
your
||UI-View setup and use.

You can do this without the max232 chip if you feel like wiring
modifing the schematic for the opentracker alittle bit, and use the 5v
supply from the linksys to power the opentracker also.

I have refused to use the aprs4r so far, cause as far as I have been
able to tell, it uses the serial port directly, where as I want to use
the linux ax25 interface instead, and I don't believe python has any
bindings that make this possible to even do.

Why do you need to use the linux AX.25 interface? Doesn't either way
accomplish the same thing? Not being smart, just wondering.

Also, where are you grabbing the 5v from inside the 54G? I probed
around inside the unit looking for 5v, but only found 3v and 12v. This
would certainly make it easier to power a 5v GPS board I have. Maybe
your 54G is different, but mine uses the 12v wall-wart.

I use the linux ax25 interface so that I can have more than just one
program talk to my tnc at the same time, if aprs4r binds to the serial
port, I'm limited to only aprs4r talking to it.

I must of been thinging of one of my other devices. But we can always
use the 12v power line to feed to the opentracker. Or could always add
a 5v reg (what the opentracker has build into it) to make a 5v source.

Actually, I was thinking about installing one of your OT SMTs inside the router and maybe running a GPS on the second serial port just for grins.

I see what you are saying now. I don't really need multiple devices where this gateway is going, but it would be great here at home. Have you played with AX.25 on the WRT54G? I see they have the packages for OpenWRT.

Looks like the early 54G v1.0 did use a 5v supply, but the other models are 12v.

Preston

Subject: Re: [APRS] Re: Embedded Linksys WRT54G I-Gate / Digipeater on the cheap!

I use the linux ax25 interface so that I can have more than just one
program talk to my tnc at the same time, if aprs4r binds to the serial
port, I'm limited to only aprs4r talking to it.

I must of been thinging of one of my other devices. But we can always
use the 12v power line to feed to the opentracker. Or could always add
a 5v reg (what the opentracker has build into it) to make a 5v source.

David,

You must also download and install a program called PMAPSERVER, This can be found on the UI-View websire. You will have to configure that program though as it was intended for use with Precision Mapping 7. Teh instructions are posted rioght on the site though.

I just loaded up precision maps 8.0 onto my laptop for use with
UI-View 32 and cannot figure out how to get UI-View to use those maps
for those maps.
The instructions on the UI View website said to open the control panel
from the "map" menu but I don't see it and the help menu isn't helping.

Patrick, any hints on the modifying the serial port on the OT+ to support the TTL signals? I believe the firmware must also be patched, to take care the polarity inversion.

> and use the 5v
> supply from the linksys to power the opentracker also.

On mine the supply is 12v, and regulated down to 3.3v on the board. So I just tapped the 12v unregulated input to power the OT+.

On the Opentracker 1plus:

Leave off parts Q2 and R11

Solder bridge the outside two pins of Q2 (two pins closest to the board edge)

That takes care of receive.

Next, one byte of the firmware needs to be patched for transmit, I
will upload a kiss patched firmware in a min. If any other firmware
images are wanted, just ask.

I meant, I uploaded the firmware to the opentracker group on yahoo.
Under the OT1Plus directory.

Patrick,

thanks for the pointers and the patched firmware. I'm going to do the surgery right now. I guess this would be a one-way job, as after I load the patched fw, then otwincfg wont be able to talk to the unit again (until I make a RS-232 to TTL converter).

Patrick,

I did the mod and put the kiss-ttl firmware on the OT+, and now I can see the incoming traffic with no problem on the WRT54.
But I still can't transmit. The LED on the OT+ never turns red, while the log file of aprs4r shows data is sent. Didn't get the chance to fire up my scope to probe around though.

hmm, I don't believe anything is wrong with what I told you, checked
the documentation on the microcontroller manual several times, and the
schematic.

I wonder if the 3.3v output of the linksys just isn't triggering on
the opentracker. Atleast this would be my best guess. Or maybe needs a
5v pullup (heh, don't take anything I say here as truth).

hmm, reading the manual, it says the lowest usable input is 3.5v (TTL
specs say 2.0 though, guess it's really a cmos input)

Looks like this will up the voltage to 5v.

Reinstall R11 (10k pullup resistor)

reinstall Q2, except for the inside pin, bend it up (normally goes to ground)

Connect 3.3v to the serial in on the opentracker (X2, pin 2)

Connect wrt54g serial out to bent up pin on Q2 (source)

Install a 10k resister between wrt54g 3.3v and serial out

I guess if we want to be totally correct, we could also add a 1k
resister between the opentracker transmit side, and the wrt54g

http://www.sparkfun.com/commerce/images/tutorials/Sensor-Interfacing/ST-5.jpg

I didn't expect this issue, cause I assumed it accepted normal TTL
values, and I know the microprocesser could run at 3.3 and 5v, didn't
think it couldn't handle both level of signals.

I have a laptop I'm setting up with microsoft streets and trips 2009 with gps that has windows vista. I'm wondering if I can have the TNC hooked into my Yaesu FT-8900R and then hook the TNC into my laptop and use the microsoft streets and trips 2009 with gps for the aprs gps at the same time running the microsoft streets progam without adding another gps? if this can be done what tnc would I need?

THANK YOU,
Ron Swart

Hi. I am being asked for advice by a local Club. They currently run a WIDE digi on a high point near Harrisburg PA. They have the option to create another WIDE digi just a few air miles away which will have slightly different coverage with a lot of overlap of the first digi, but will have access to a broadband connection so that they can also run an Igate at the second site. My question is, so long as the digis are running on newish TNCs with up-to-date code, can they co-exist without causing each other problems?
TIA

Ron,

Can't answer your question about a TNC directly, but if you are using computer based APRS tracking software, most of the miniTNCs should work fine in KISS mode. I would guess that you will need to choose whether to (1) have a GPS dedicated to your TNC (like with TNC-X, OpenTracker, etc) and a second GPS to the mapping software or (2) have your mapping software "share" a GPS with your computer based APRS tracking software...

Since I only dabble with mobile APRS, I run DeLorme Street Atlas (or Topo USA) and AGWTracker simultaneously with one GPS unit on a laptop. AGWTracker plays well with most KISS TNC's. I use the DeLorme Earthmate LT-20 "USB mouse" GPS with a utility they supply online called the "DeLorme Serial Emulator". While the GPS is "talking" to the mapping software normally, the serial emulator utility copies and sends the NMEA data stream to a "virtual" serial port which AGWTracker sees as "real". It works well here even though you must give the utility admin permission to load and run during boot up because of M$'s misbegotten *&^$^%^* UAC. (Yes folks, only on a Vista based laptop! Bleah.....)

My mobile set up is a Dell E1405 Laptop/AGWTracker-SignaLink USB interface/Yaesu FT-817. I have also used AGWTracker with an old AEA PK232 successfully but it is a space monster and a power hog -- not terribly mobile. I have to assume that other windoze based APRS programs that require an RS232 serial GPS will work just fine too... I happen to be lazy, found George's software, and liked the way it worked enough to register it (saves me checking aprs.fi or the OpenAPRS website when I'm connected).

Reading through the documentation on the DeLorme serial emulator, it is apparent that the Magellan USB GPS units also work with the utility. My guess is that Microsoft may have a similar utility if it is designed to use USB GPS units... check their Streets website.

Hi Scott,
What is a few air miles apart and will they see each other
,clear line of sight ?.

There is no reason why these can't co exist some planning would be needed
and to cut the over lap down you could always run a small yagi on each site
back to back pointing the front in the direction you need the most signal
for the best
mobile coverage allowing the lobe between the two to pick up the rest.

Have you or has there been any site tests ?

What power out ?

There a a few things that need to be looked at ..

I am sure others will have ideas as well..

Good luck

Subject: [APRS] WIDEs Near Each Other?

Hi. I am being asked for advice by a local Club. They currently run
a WIDE digi on a high point near Harrisburg PA. They have the option
to create another WIDE digi just a few air miles away which will have
slightly different coverage with a lot of overlap of the first digi,
but will have access to a broadband connection so that they can also
run an Igate at the second site. My question is, so long as the
digis are running on newish TNCs with up-to-date code, can they co-
exist without causing each other problems?
TIA

5673. Ubuntu/Soundcardmodem/Xastir

Yahoo group: APRS (2007 — 2010)
Date: 2008-10-26 20:59:49 UTC
From: Damon
Topic: 5673 Message: 5673

Anyone have a working Ubuntu-Soudcardmodem-Xastir setup going. I have spent the last week trying. I know my xastir works. The problem seems to be in the soundmodem program. (got it from the ubuntu download). I set it up following the instructions here:
http://www.kj4ajw.com/node/17 .

It seems to work. Im getting it to show on the scope during diagnostics and on the modem. But it doesn't show any packets received. I see on the scope when packet activity happens, but still nothing. I have tried 3 diffrent radios (IC208H, IC-91AD & a radio shack scanner) just to see if it is the radio with the same results. I even tried it by using AOSS with it in the command. Same results. I am fresh out of ideas.
Someone who has it working please let me know.

UI View in host mode to kpc3 tnc.Radio is ft 8800, with data from factory radio port to db9 at tnc.

TNC recieves well as i gate, however it seems tnc is locked in recieve mode, (light stays on), and will not release to allow rf transmission.

i am not running as digi, only igate, but the tnc will not transmit base station (fixed) info.

minimal working knowledge with tnc, but with a bit of direction may be able to fix situation. Any ideas? All opinions welcomed.

Thanks in advance, Dave N4DJJ

Couple of possibilities to check:
Are you running speaker audio into the TNC? is the squelch open
keeping the RX LED on
How do you have your CD set on the TNC? Carrier Detect Probably is
INTERNAL, if you're running open squelch or the FT8800 is feeding it
discriminator audio then it should be CD SOFTWARE

Hope this helps.

First the Yaesu FT-8800 has a data port on the back of the radio, Did
you change the menu item number 27 to fix left or right side transmit?
Next menu # 26 needs to be set to 1200bps if your on 2 meters or 9600
on 440/70cntmtrs (you can go 12/24/9600 on both but 1200 is best for 2
meters). Let us know if that helps.

5678. APRS-IS and gating onto RF

Yahoo group: APRS (2007 — 2010)
Date: 2008-11-02 18:44:18 UTC
From: Stephen
Topic: 5678 Message: 5678

Been searching for info on this and can't seem to find any answers...

I have setup a WX station here at my house that is posting to APRS-IS, that's working just fine. I am trying to figure out how to have it appear on the RF side of things thru a Igate, or at a minimum, br able to query it over RF.

I am running a PeetBros Ultimeter 2100 with Virtual Weather Station using VWSAPRS to post the data every 10min. Been working fine for a week now: http://www.findu.com/cgi-bin/wxpage.cgi?call=kv6o&last=24

I got a validation code from Russ at noaa.gov that, from what I understand is needed to gate to RF :

http://home.comcast.net/~dshelms/vws_aprs_setup.html

I have never seen it gated, nor can I query it using ?APRSS - what am I missing?

Thanks
Steve

Gating to RF is not automatic. In other words, everything heard on RF
is gated to APRS-IS but only messages are gated to RF from APRS-IS
automatically.

If you want your weather station packets gated to RF, you need to talk
with your local IGate operator and ask that they add your station to
their "Always gate to RF" list. This is specific to each IGate
operator since it is their station that is being used to transmit on RF
and therefore they are the ones liable for content transmitted.

One way to get your reports over the RF port is to run an APRS client like UI-View 32. You can connect to a server, and send your reports into that server at a specified time, like every 5 minutes. You can then also specify how often it reports over the air, like once every 20 minutes. You can send them just direct from your station, or via your local digipeater(s) but I wouldn't recommend anything over one hop with WX data.

I am running UI View 32 (Ver 2.03) and doing this exact thing with Weather Text Tools and the Ultimeter 2100. UI-View is a free download, but takes a day or so to get a registration code (free also). For more info, just let me know.

>setting up APRS the WAYPOINT options offer a variety of digit positions
>for NMEA. I don't understand what the differences in the number of
>digits are and what would be the best choice.

The older GPSes won't have waypoints with more than 6 characters.
With 6 characters, a longer callsign will be truncated; only the right
6 characters will be stored and displayed, e.g. 2BBA-9 for my callsign
when the callsign is set to LA2BBA-9

Newer GPSes accept longer waypoint names with 9 characters, so e.g.
LA2BBA-15 would be displayed.
I have set my D700 to use 9 characters.

(Hope that was what you meant)

Why is it that Hams are always having to re-invent the wheel?

It seem like everytime I get on an APRS group someone is asking how to configure a Digi, an Igate or a tracker. There are a lot of good working systems out there. Let's start posting the configurations in the file section. If you have a TT3 configured as a Tracker, post the settings. If you have an OT2 configured as a DIGI, post the settings. If you have an MFJ configured with UIDIGI, post the setup. There are lots of different types of TNCs and uses. Lets get these posted.

Just because you were smart enough to figure out how to configure all these settings, doesn't mean that everyone is. Share the knowledge.

Thanks

info.aprs.net was created just for this sort of thing. If you're going to contribute information, consider doing it there. The problem in the past has been that the information has been too scattered, and it gets out of date fast - you can find all sorts of bad advice on paths, for example. At least on the wiki someone can fix things if necessary. Lots of bad web pages will stay out there abandoned for years.

From: RobertCGRO
Topic: 5681 Message: 5687

Hello fellow APRS/CE user. Finally, I met someone else who uses it!
Just joined the group and saw your post.

Don't have a KY map in my files but these links take you to several
sites that may have something. I'm not familiar with the cities in
your state, so perhaps something can be found in the tapr ftp files.
the 013964.html text has a discussion on using these maps although
they are larger since they have more detail.

I use a Dell Axim X50V with a CF GPS and wifi lan card if I'm near a
free site or at home. On the road, I can link my D7 and eTrex GPS
with Serial I/O's serial adapter cable (excellent cable to add serial
devices to your Axim).

Also have MS Streets and Tripss loaded and found that I can task
switch between APRS/CE and it and still have my GPS position showing
on boat. The advantage of the eTrex over the CF GPS is that I get 2-
way NMEA messaging and any APRS stations show up on it's display as
well as the APRS/CE map.

http://wetnet.net/~we7u/xastir/maps/pocketaprs/
http://www.homepages.hetnet.nl/~pe1dnn/
http://www.tapr.org/pipermail/aprssig/2006-May/013964.html
ftp://ftp.tapr.org/aprssig/maps/

Making the maps is not easy as PE1DNN explains. Perhaps the software
developers at APRS/CE will come up with something. Hopefully, these
links can point you on the right track, or maybe even have something
that you can use.

73,
Robert, VA3ROM

From: RobertCGRO
Topic: 5681 Message: 5688

Hi Karl,

Nice to met up with another APRS/CE user. Don't seem to be many or us around but APRS on a PDA is the way of the future.

Here are some links that may help. I don't have a KY map handy.

http://www.homepages.hetnet.nl/~pe1dnn/

http://wetnet.net/~we7u/xastir/maps/pocketaprs/

ftp://ftp.tapr.org/aprssig/maps/PCMaps/
ftp://ftp.tapr.org/aprssig/maps/WinMacMaps/

The tapr maps are larger and more detailed and some will work with APRS/CE.

I use a Dell Axim X50V with my D7 and eTrex GPS connected via Serial I/O's excellent adapter cable on the road. For at home wifi use, I use a CF GPS and wifi to my UIVIEW desktop running as a filtered server. My camp is within radio contact of my home, so I can setup either a PDA or laptop station and run a bit more power with a 2m radio to access my home station. Not wifi but I'm thinking about TOR using AGWPE.

My Axim also has MS Streets & Trips pocketPC installed and I can hotswitch between APRS/CE and it to have a dual purpose use for the GPS. The eTrex being able to save the displayed APRS stations for later inspection and loading to my Waypoint Manager software.

Perhaps the developers of APRS/CE will come out with a map editing/creation tool. Right now, it's not easy.

73,
Robert, VA3ROM

http://my.tbaytel.net/va3rom

5689. RE: [APRS] Re: APRS-IS and gating onto RF

Yahoo group: APRS (2007 — 2010)
Date: 2008-11-10 22:06:43 UTC
From: Chris Greenhalgh
Topic: 5678 Message: 5689

As a high profile digi and igate operator, you better have a VERY good reason for me to gate your data from the internet to RF.

Inserting objects/data straight to the internet is not APRS (the "P" stands for "Packet"), and we have had many stations around here, who have abandoned their RF station to do just that, but sorry...that aint APRS, or in the spirit of amateur radio.

What else they don't realizes is, that the only stations (RF only) that would benefit from their data, they are excluding!

I personally, would block any station gating internet data to RF, from going though my digi. Again, there are some VERY rare exceptions, but for the most part...nada.

Gating to RF is not automatic. In other words, everything heard on RF is gated to APRS-IS but only messages are gated to RF from APRS-IS automatically.

If you want your weather station packets gated to RF, you need to talk with your local IGate operator and ask that they add your station to their "Always gate to RF" list. This is specific to each IGate operator since it is their station that is being used to transmit on RF and therefore they are the ones liable for content transmitted.

As a high profile digi and igate operator, you better have a VERY good reason for me to gate your data from the internet to RF.

Inserting objects/data straight to the internet is not APRS (the "P" stands for "Packet"), and we have had many stations around here, who have abandoned their RF station to do just that, but sorry...that aint APRS, or in the spirit of amateur radio.

What else they don't realizes is, that the only stations (RF only) that would benefit from their data, they are excluding!

I personally, would block any station gating internet data to RF, from going though my digi. Again, there are some VERY rare exceptions, but for the most part...nada.

Chris,
You raise some valid points. But when I have my IGate running, there are 2 to 4 hams I gated during the bi-annual migration to and from Florida from Ohio. That way the ones here that are RF only can track and correspond with them. Once they get down there and park or back up here I remove them.

Actually this weekend the 15th, I'll be gating my Alinco DR-135/T2-135 and HamHUD configuration for our trip to the Ft Wayne IN Hamfest.

I think these are good reasons. Not knocking ya Chris, just showing the flip side...(I've visited your website and am very impressed)

Cheers and 73,
Stan/KC7EHJ

Wouldn't you know it, just as the hair pulling
starts, I sorted it.
Probably more by luck than anything else.

I pulled up dear old Pocket Packet, and
got the THD7 and the IPAQ talking to each
other within a matter of minutes.

Spotted the problems, (baud rates !) and
made appropriate changes.

It looks like the baud rate changes I was
making within the APRS/CE set-up was not being
taken any notice of by the radio.

73, Dave.

Hello,

I've been fooling around with APRS for a while and even though I have a system up and running, there's a lot I need to learn.

Last June I was on a motorcycle in Pie Town, New Mexico, a place where my cell phone doesn't work. I'd met up with a summer thunder storm and took refuge beneath a shelter to wait it out. As rain drops the size of my thumb pelted the tin room I found a signal from a Fence Lake digi and sent a message home to my YL, kc7bsy, using my TM-D710. Even though I had no part in running the digi, or designing the 710, I had a feeling of accomplishment.

Not so long ago, using packet, I'd have had to brought my big 286, a tnc, a radio, and then found a way to power everything. And after the message was composed I would have had to pick a digi path to Texas. She might still be waiting for that message.

Times have changed.

From: Mark Thompson
Topic: 5696 Message: 5696

http://www.arrl.org/news/stories/2008/11/13/10448/?nc=1
ARRL to Offer Self-Study Course on Digital Technology for Emergency Communications

A sample of what The ARRL Digital Technology for Emergency Communication Course offers.
?
With digital technology becoming an integral part of Amateur Radio, hams interested in Emergency Communications now have a new tool to help them take advantage of emerging modes such as Packet Radio APRS, Winlink 2000, IRLP, EchoLink and WIRES-II, D-STAR, APCO25, HF sound card modes and Automatic Link Establishment (ALE). The ARRL Digital Technology for Emergency Communications Course http://www.arrl.org/catalog/?item=1247?will introduce hams to all of the ways Amateur Radio operators are using digital technology as a valuable emergency communications tool.
Written by ARRL Publications Manager and QST Editor Steve Ford, WB8IMY, this self-study CD-ROM will answer such questions as:
?
* Can you transfer supply lists or personnel assignments between emergency operations sites?

* Can you get critical e-mails to the Internet if a connection goes down?

* Can you relay digital images of damage at specific locations?

* Can you track the locations of emergency personnel and display them on computer maps?

* ?and more!

Illustrations, screenshots, Internet links and audio files are used to demonstrate transmission modes and equipment configurations. Bite-sized learning units and interactive knowledge checks make learning interesting and fun!
?
"This course is a great starting point for anyone interested in the public service applications of digital communications technology," said Ford. The ARRL Digital Technology for Emergency Communications Course is available from the ARRL for only $49.95.
?
Minimum System Requirements for CD-ROM -- Microsoft Windows Vista/XP/2000/NT/98/95 or Apple OS X; 200 MHz processor; 32 MB RAM; sound card and speakers; 4-speed CD-ROM drive or higher. Requires Web browser -- Microsoft Internet Explorer 6.0, Mozilla Firefox 2.0, Apple Safari 3.0 or later versions. Some documents require Adobe Reader.

Hi Preston,

I'd love to see a how-to for this setup...any pointers in getting openwrt & aprs4r (my German is pretty rusty) installed/configured without bricking it would be greatly appreciated. :-)

I picked up a WRT54G-TM last week (from Tmobile web site) and have been playing with dd-wrt on it...will be adding serial ports this weekend to support my OT+ and am also thinking about adding sd/mmc capability. FWIW, I'm pretty impressed with the functionality + value in this combo. May have to get another one to replace my ancient home router. ;)

If you are going from dd-wrt to openwrt, I would wait until you have your serial ports installed. It is just a matter of flashing following section 4.2 of this guide:http://wiki.openwrt.org/OpenWrtDocs/TroubleshootingThen it is just a matter of running the aprs4r install script:http://www.aprs4r.org/cgi-bin/trac.cgi/wiki/OpenWrtAPRS4RInstallationIf you are using a router w/o USB ports, such as the WRT54G, you can comment out the lines that install the USB drivers. If you get stuck with the configuration, I can try and help you out. Not to many "gotchas" with this project, but the German instructions can be a pain. What radio interface are you going to use?I have had my router/gateway up for several weeks now and it has worked without a hitch. I Preston, N5YIZ

Parts for the serial ports didn't show up this weekend but I decided to load OpenWrt anyhow. Not living too dangerous as dd-wrt did most of the hard work like the CFE & turning on boot_wait... ;-) FWIW, I used a Kamikaze 7.09 image (openwrt-brcm-2.4-squashfs.trx) with the tftp install. Which openwrt image would you suggest for the WRT54G-TM?

Just starting the aprs4r install and will be initially connecting an Argent OT+ & Icom T90A HT as I've already got that cabled...may also try it with my Kenwood D710A.

My goal for this box is replacing a UI-View Igate. We've pretty good Digi coverage in Northern Arizona already, but I may build up another as a portable solar/battery powered fill-in Digi for when I'm out doing my other addiction: Rally (off road racing).

Thanks, Brent KE7JGM.

5703. Update on the Micro-Trak TT4 (MT-TT4)

Yahoo group: APRS (2007 — 2010)
Date: 2008-11-25 00:11:06 UTC
From: vhsproducts
Topic: 5703 Message: 5703

It looks like we are dangerously close to having the MT-TT4 ready to ship, about mid-December. We will initally release the unit as a fully assembled and tested PC board, but we are working on a custom enclosure which can be added later. The device will feature a special version of the TT4-D software and measures 3.1 X 3.175 I am confident that this will appeal to many SAR users looking for a small portable stand-alone digipeater. There is a PS/2 connector for a PC style keyboard,(not yet supported in firmware) an RJ-45 output for a remote LCD display, and of course an RJ-45 for telemetry inputs. This is a 1/2 Watt transceiver, and can do tracking, digipeating, KISS or pretty much anything a regular TT4 can do. We expect to develop an amplifier similar to our Micro-Amp for this unit in the very near future.

5704. Maximum power on packet?

Yahoo group: APRS (2007 — 2010)
Date: 2008-11-28 01:08:55 UTC
From: Chris Greenhalgh
Topic: 5703 Message: 5704

When I got my license many moons ago, I thought the maximum power for an unattended digital VHF station (say, an APRS digipeater) was 100 watts.

Now, for the life of me, I cant find that definition anywhere in part 97.

Two questions...(1) what is the maximum ERP for the above mentioned station, and (2), has it changed in the past 20 years?

I know I'm getting old, but I thought I knew this one for sure. :)

There are power limits for certain bands based on the allocation and
the geography of the area (for example, there are geographic limits
for 70cm, 33cm, and 23cm). There are also power limits placed on
Novice class users as well but those are the only restrictions
currently in the rules. The FCC rules for 2 meters does not have any
specific power limit specified other than the standard "minimum
necessary to accomplish communication" so, technically, you can fire
up a 1.5 kW linear amp and have a super high power digipeater.

APRS is Automatic Position Reporting System originally developed by Bob Bruninga. It's a communication network used by AmateuJust getting into digital mode for HF/VHF...

Question: This may have been answered before, but need to ask again - which GPS receiver can be used for both APRS and normal driving?

Any GPS with both a serial port (NMEA) and routeable maps.
For APRS, it shouldn't only have NMEA output, it should also accept
waypoints received with the radio/TNC.
The routing is needed for street navigation.

One such GPS is Garmin's GPSMAP276.

I have a Garmin GPSmap 276C which I use for travel navigation and
APRS. Very happy with it. When combined with a Kenwood TM-D700, the
APRS beacons received by the D700 are displayed on the 276C as waypoints.

Looks to be the same one sold by Infinity Gear and GISTEQ. I got a chance to take one apart and do some analysis, but I'm still not sure exactly who manufactures it.

Not directly usable for APRS in any case... it has a CML Micro GMSK modem.

That looks pretty cool. I'm not sure why it wouldn't work with "digital radios" as long as it parses NMEA 0183 strings at 4800 baud. If so, then it would work fine with my IC-91AD as well as the D7. I'm also a bit confused on the connector diagrams, which only show two connections (speaker/mic) in the traditional config for brand-specificity. I wonder where the third connection is for the gps? Must be a separate lead from the mic?

Please do tell if anyone researches this in more depth or decides to pony up and spend the $- it could be a fantastic addition to the portable APRS/DPRS repertoire.

It wouldn't work with a digital radio (e.g., APCO-25) unless there's some other accessory digital input. The mic puts out an audio signal with 1200 bps GMSK tones - that's not going to survive being run through an AMBE codec.

> (speaker/mic) in the traditional config for brand-specificity. I wonder
> where the third connection is for the gps? Must be a separate lead from
> the mic?

It's got an internal GPS receiver. The plastic bit on top covers the antenna. I took some pictures of the guts that I can post sometime.

I captured a bunch of packets from the audio output, and then some raw data that I tapped off the modem IC input. I didn't capture enough packets directly to make decoding the format easy, so that'll have to wait until I get a demodulator written to handle the audio captures. It's not high on my list right now, though.

Quite a few people. See the "Tracker2" TNC which can do mapping and
2-way APRS messaging using a Nuvi 350. There's a version of the
Tracker2 that fits inside the Alinco DR-135T radio as well called
the T2-135.

There is only one device suited for APRS that I'm aware of that works with the Nuvi. That would be the Agent Data - Tracker2. I believe there is also software for PC's that will convert the Garmin binary output of the Nuvi's to a usable format to other APRS applications.

With the Tracker2 and Nuvi plus the special FMI cable from Garmin, you can send APRS messages from the Nuvi along with the normal position report capabilities.
The Nuvi 350 will also show received position reports on the Nuvi display as waypoints. (other Nuvi versions seem to have a problem with not updating the waypoints from the tracker2 and cause "breadcrumb" effect)

Yes- I was wondering about the connection for the _output_ of gps data
from the speaker mic to the rig.

Either way, it sounds like it would take a lot of work to make it
function for portable APRS. Thanks for the info, Scott. I think I'll
stick with the D7 and foretrex 201. It is really a pretty
elegant/simple setup.

Yep - I do it in two vehicles, N7QNM-9 and KD7ULH-9. I'm using OpenTracker-2s (the T2/135 model) with the Garmin NUVI 350 and Alinco DR135s. I actually have it set up so that when I'm using the Nuvi T2 uses that; and then when I disconnect the NUVI, I have Deluo GPS in one car and a Garmin GPS-18 in the other.

Works great! If you do a search on the archives here there are some discussions; and you can also search yahoogroups for "OpenTracker" and join the OT2 group.

I've been researching this today...

The 350 is listed as discontinued at the Garmin site.

https://buy.garmin.com/shop/shop.do?cID=164&pID=31655

eCost.com has factory refurb for $138.99, new for $165.99.

I think the feature we need is something about 'fleet'. I don't see
that feature listed for other current models. Does anyone know if
what we need is available in newer current models? Or is the 350 the
end of the line for us?

Check costco and walmart too. It's definitely a deal right now.

"Fleet mode". The place to research this topic is the archives for
the Tracker2 mailing list. It's all been discussed there in
infinite detail.

The short answer is that many of the other models have it as well,
but the 350 has the display waypoint feature (not part of "fleet
mode") which works well for what we do, as Clay just described.
Many of the other models start displaying multiple waypoints when a
station moves instead of moving the waypoint on the Garmin map
screen.

I think the Rino uses some sort of 600 bps baseband FM mode. Haven't had a chance to check one out myself. I think the only way for now to use the Rino is to have one at the base station and have Xastir or something dump the waypoints periodically.

You could do the same with the GPS mic, I guess. I reverse engineered enough of the output string to implement it in the Tracker2, so you can use the T2 to track APRS stations in ArcGIS.

I've also got a converter cable in the works (beta units available this week, maybe) that'll translate to and from NMEA, so you can use the nuvi 350 with the D7/D700/D710 or whatever. It doesn't have all of the features of the Tracker2, but it's a good alternative to the AvMap.

Other nuvi and StreetPilot models will work for position data, but they don't plot waypoints correctly. I may be able to get around that for some of the new models that support the FMI v2 protocol, but I'm not sure yet.

Still trying to get some beta units done. Probably by the end of the
week I'll have a few.

It plugs in on the bottom, I think.. I used one at SARcity, but I didn't get to borrow the data cable while I was analyzing the loaner unit.

Scott,

Question on the Nuvi 350 and maybe someone else can answer as well. Is there a way to if you need to send out an emergency beacon? I know the 350 has the ability to send messages but is there a way to activate an emergency beacon if you had to?

Let me know.

I've also got a converter cable in the works (beta units available this week, maybe) that'll translate to and from NMEA, so you can use the nuvi 350 with the D7/D700/D710 or whatever. It doesn't have all of the features of the Tracker2, but it's a good alternative to the AvMap.

Other nuvi and StreetPilot models will work for position data, but they don't plot waypoints correctly. I may be able to get around that for some of the new models that support the FMI v2 protocol, but I'm not sure yet.

You can use the nuvi to set the comment text to EMERGENCY, which will
trigger at least some of the clients.

5730. Digi Desense

Yahoo group: APRS (2007 — 2010)
Date: 2008-12-07 03:45:27 UTC
From: n7zef
Topic: 5730 Message: 5730

Howdy;
Seem to have some problems with a couple of our local hilltop digi's...They are getting desensed by commercial stations. The first one is on a 11,000 ft mtn top, and shares a bldg with a recent 500 watt FM station. The antennas are in a cone, so the spacing is close. I had the digi brought down until we can find out what to do.
The next digi to have problems is being desensed by the TV station xmtr it shares the bldg with. It had been running fine for many years (almost 10) until the station went to digital. Now it won't even hear the next digi 35 miles away. I thought the antenna blew down, but I noticed tonite the TV station was off air, and now I can see the digi west of here.
Does anyone have suggestions on how to cure without a lot of $ or needing more space. These sites we are in were donated to us, so we must keep it simple and clean. We use the HT-202 radios because the work the best and are usually not affected by close by traffic.
Thanks in Advance...

I too have a high profile digi in a high inter-mod area. I found the DCI filter eliminated 99.9% of all the crap out there.

I recommend the 2 MHz unit for packet, and if it will live on APRS, I believe DCI will center line it 144.390 MHz.

Yes. You'll need the Garmin 010-10813-00 cable. If you order it from www.argentdata.com, there's an option to have a female DB9 added on - for the T2-135 you'll need a male DB9. If you want the male DB9 on it, just order the female DB9 and make a note in the order comments that it's for a T2-135.

Interesting so, even though the specs in the manual and on the Garmin website don¹t indicate IMEI output there¹s some kind of output the T2-135 understands???

Of course, the answer to this question opens up a number of other questions regarding other units and 2 way APRS???

Thanks,

5735. RE: [APRS] Digi Desense

Yahoo group: APRS (2007 — 2010)
Date: 2008-12-07 20:52:58 UTC
From: Derek McIntyre N4DBM
Topic: 5730 Message: 5735

HT-202's have a receiver front end about as wide as a barn door. Something like an old Mastr Exec II would probably work very well in a congested, high power area. But since you've already got the digi in place, a sharp band pass filter would be the answer.

Since a lot of VHF commercial and public safety stuff is going to 800 MHz, you can usually find band pass filters on E-bay or E-ham pretty regular under the "for sale - repeater" category. You can tune the filter yourself using a signal generator and a SINAD meter, or a good ear to detect a full quieting signal. Putting the filter directly in line with the antenna will of course filter the TX signal out of the radio, too, which can prevent other transmitter signals from mixing in your HT-202's PA and causing unwanted intermod at the site.

Most band-pass filters (like dupelxer cans) that are PASS ONLY usually have about 1.5 dB of loss. Not enough to worry about. The more loss thru the can, the better the selection. Most cans are adjustable by rotating the coupling loops to set the loss and selectivity.

Contact me off list for more info. I believe I also have some 4 pole filters that may work well for you that came out of some old junk Micors.

Another issue may be that a band pass filter will NOT help - it's unlikely, but the new digital transmitter may be putting out unwanted RF on your frequency. Even if it's just a few microwatts, that signal can certainly cause desense on your RX, especially if it's at the same location.

>band pass filter would be the answer.

Actually, the HT-202 has one of the best front ends of any amateur grade HT. It was designed that way to cover only the amateur frequencies. Notice how there are no mods to take the 202 out of band?

That being said, any amateur grade HT probably has no business in a fixed digi application, especially when there are any other transmitters around. I know, many probably get away with it but it not a great way to do it. An HT is typically designed for max sensitivity and as a result has a poor dynamic range and selectivity.

In this case a single can may well solve your desense problem if attention is paid to proper shielding and grounding. (No foil shielded coax.) A DCI filter may help but they are band-pass filters, 2 to 4 mhz wide. You probably would have better luck with a more narrow simple can filter.

I routinely have to use repeater antennas in the near field of 50 KW FM transmitters and often see several watts of RF from the coax coming back down. A shorted 1/4 wave stub at my frequency on a tee often will make the antenna suitable for repeater use. A stub may work for you here. They certainly are cheap and simple to construct.

An old Micor is still the gold standard for repeater/digi applications with (arguably) the Mastr II or Exec a very close second.

Most commercial site operators will not allow any amateur grade equipment on site for very good reasons.

5738. Byonics or OT+ With Garmin Vista Cx ?

Yahoo group: APRS (2007 — 2010)
Date: 2008-12-10 01:27:13 UTC
From: Phil
Topic: 5738 Message: 5738

Hi All... in a bit of a pickle..

A few years ago when I bought my Garmin Vista Cx I thought to myself
that it didn't matter if the GPS was USB or Serial, since everything is
USB now anyway - and its just easier.
I couldn't be more wrong!

I bought the GPS to use while taking pictures so I can geo-map my
images. Now - I'm thinking it could do double duty as an APRS GPS.

I understand that Serial would have been the best option, but will the
Garmin Vista Cx work with any type of Stand-Alone APRS Tracker?
The reason I ask is because I have a Palm Vx just sitting around, a RS
HTX-202 that only wants to do .5w, and a GPS that isn't being used as
often as I would like. All that is missing is an APRS tracker and I
have a nice portable (maybe even mobile) APRS setup.
I'm just unsure if my GPS would fit the bill
Thanks for the help
Phil

As far as I know, the Cx has no serial output option at all. It won't work with anything short of a full USB host, which basically means a PC.

The newer USB handhelds like the Colorado 300 can switch to a serial mode that'll work with APRS trackers, but I don't think that's true of any of the eTrex USB models.

5740. Garmin Nuvii 200

Yahoo group: APRS (2007 — 2010)
Date: 2008-12-10 15:41:58 UTC
From: Rodney
Topic: 5738 Message: 5740

A few weeks ago I asked about using the Garmin Nuvii for APRS. Problem is everyone who responded referred to the 300 series unit.

I have the Nuvii 200 series unit.

Has anyone ever used this one for APRS?

Thanks!

Rod

None of the 200 series seem to support the fleet management interface,
so it would appear there's no way to get position data out of them.

The Micro-Trak TT4 is out and available on the Byonics website. http://www.byonics.com/microtrak/mt-tt4.php Initially, we are offering it as an assembled and tested board, with custom cases avaiable in the next few weeks. it weighs less than 3 ounces, measures about 3 X 3 inches, and will operate as a tracker, digipeater, etc. Let me know what you think.

From: Art
Topic: 5743 Message: 5743

I have created a new mailing list for the purpose of trading or selling (or bartering) surface mount components.

I have many that I don't have an immediate need for, and I'd gladly trade them for components that I do need, so identifying who has what is the first step.

All are welcomed to join, no strings attached.

http://groups.yahoo.com/group/ Electronic_Component_Exchange

You will have to make a pertinent comment of some sort before being allowed to join, this is strictly an antispam measure.

Enjoy.

Vista is only trouble for most anything to do with radios or aprs.

Might look around on epay for one that runs xp you would be better off.
Just my 2 cents worth.

Create the .inf files and save it to the Vista Desktop. After that you will need to move it to the directory you want to put it in. You will be asked for administrative approval to complete the move even though you are the administrator. Welcome to the wacky world of the Vista UAC which will not let you directly save a file into the \Program Files\<Program name> directories.

That actually is not true. To get an eBay copy of XP is inviting disaster.

AGWTracker/AGWPE work quite well as do a fair number of other bits and pieces of solid radio control software (HRD/DM780 and MixW for example). You would be best to stay with Vista *so you can maintain manufacturers support* for your laptop. If you must backgrade to XP, get the XP "backgrade" disks from your laptop manufacturer so you don't null your warranty.

With Vista, you must take the time to understand how the UAC works. Don't forget there is a protected directory separate from \Program Files\<Program Folder> called C:\Users\<your username>\AppData\Local\VirtualStore\Program Files that has the working configuration files in them. If you are using soundcard devices, you need to be careful to configure them properly as most older applications can't find the correct interface handles. Under most circumstances you will not be able to run much older programs that have not been updated since XP SP2.

If you need a different operating system, don't waste your time with Windoze at all, just create a separate partition and put on your favorite distro of Linux... you'll not regret that move. Oh yeah... Hmmm... that last part would be be my "two cents". :-)

What you mean is that most pre-existing software and hardware -- will not
run reliably under Vista unless 1) you have a
much-more-than-"minimum"-Vista-system; and, 2) the hardware manfacturer is
still trying to sell that specific model and therefore has published at
least some passible Vista drivers.

> If you need a different operating system, don't waste your time with

> Hmmm... that last part would be be my "two cents". :-)

Assuming, of course, that you really do enjoy obscure syntax, searching for
your own drivers and your own software, and marginally usable compatibility
with common file formats.

Linux may well be the operating system of the future -- Vista is certainly
the best thing that ever happened to Linux.

But in a world where 99% of ham radio software is still written to expect a
hardware "com port" don't count on much support for any hardware or software
younger than you are.

I run Microsoft Virtual PC and I have Windows XP installed as a guest OS with no problems. HP doesn't have a XP rollback for this computer and it will void my (5yr) warranty if I install anything other than Vista which is what came with my machine. Check with your warranty support group before changing OSes.

So with XP installed as a guest OS I just run all my radio apps in XP and Vista never knows the difference. I do run UI-View and javAPRSSrvr under XP as a service as well. Then full station control after adding a 6 port serial card.

On the brighter side of things...

Turn off UAC in Vista and it won't balk at you anymore.

Hi Ian,
It is well documented on this list that a certain build of APRSD
had problems I understand that this has been corrected in the
updated version I also don't know if this could be part of the problem..

Has any one tried Ui-View via the same digi and if so what were the results
?.

Lets eliminate the Software then the KAM try a Paccom tiny 2 or something
different..

What type of Digi is the data passing through UI-Digi or a Ui-View ./ Linux
etc ?

What model KAM TNC ?? if its a KPC3 these are know to cause issues as well
again documented on here and other lists

From: "Iain Young, G7III" <g7iii@...>

>> Do you know what APRS Client and TNC are being used by G7III

>G7III is running Linux and was using beacon(1) to generate the packets
>himself. TNC is a KAM, being driven as a KISS device by Linux.

5755. Micro-Trak TT4 and amplifiers

Yahoo group: APRS (2007 — 2010)
Date: 2008-12-18 00:44:33 UTC
From: vhsproducts
Topic: 5755 Message: 5755

Just a quick word, I understand that a few people have ordered the Micro-Trak TT4 with the Micro-Amp. The Micro-Amp is uni-directional, and will not let you receive signals back thorough it. Also,the MT-TT4 can have up to 625 Milliwatts of output power, which is WAY too much to drive the Micro-Amp with. You would need to use an inline attenuator to use it as a transmit-only device. We will be releasing a 10 Watt switched amplifier that wil be suitable for use with 1/2 Watt transceivers, but the Micro-Amp is not a good choice for the moment.

5757. Manually Place a Station on the Map

Yahoo group: APRS (2007 — 2010)
Date: 2008-12-18 14:03:20 UTC
From: usna71
Topic: 5757 Message: 5757

Hello: I am working with SAR and would like to use the system to place objects on a map using the APRS database. The objects I want to put on the map are HF relay stations across the state. Is there a way I can put a station on the map without going there with a Tracker set to the ID of the station? In otherwords, is there a web interface to the APRS database to place a station ID in there with a location? The idea is to project the map for situation awareness as we track our other assets.

73,
Bill

Hi Bill,

There is no "APRS database". APRS-IS is a real-time interconnection between RF APRS networks. There are a number of people (myself included) that parse those APRS "packets" and populate various databases (aprs.fi, aprsworld.net, findu.com, jfindu.net, etc.). APRS-IS is there to support amateur radio APRS communications so you should look at it that way. If the HF relay stations are amateur radio stations, they can be "put on the APRS map" by generating APRS objects using APRS client software. Keep in mind that APRS-IS primarily exists to support amateur RF networks so consider if those stations are of interest to the RF world. If so (like the Winlink packet stations, for instance), then this is a great way to get them out to all usage areas.

If you are only thinking about populating a map for display at a central location, then maybe manually populating that map might be a better way to go. The general premise for APRS-IS objects has been "is it amateur radio related, of value to one or more RF APRS networks, and is it not commonly available via other commercial means". These are just guidelines to keep in mind. Just food for thought.

73,

Pete AE5PL

Situation awareness is what the APRS system was designed to
accomplish.

Most APRS programs can place either "objects" or "items" on the map.
Situation awareness is what the APRS system was designed to
accomplish. Some are also capable of generating web pages based off
their display for viewing by others.

I'm in SAR here in WA and have placed the locations of the DEM and
SAR repeaters on my local map as objects. I'm not transmitting them
out so at the moment I'm the only one that can see them on the map.

For a somewhat complete list of APRS applications and their
features, see this page:

http://www.eskimo.com/~archer/aprs_capabilities.html

Note also the "SAR_APRS@yahoogroups.com" and "APRSSIG@..."
mailing lists, more places to get help.

Copied the line up and forgot to delete the 2nd one. Oh well.
Wanted to say one other thing anyway:

There's little difference between "Objects" and "Items". Items use
a shorter representation because they exclude the time/date stamp,
but Items have been deprecated from the APRS spec.

The software I use encodes/decodes Items properly and I still use
them at times.

5763. Fwd: ARLS009 ARISS Finalizes Plans for Silver Anniversary of Amateur Radio from Space

Yahoo group: APRS (2007 — 2010)
Date: 2008-12-19 03:06:00 UTC
From: Mark Thompson
Topic: 5763 Message: 5763

SB SPACE @ ARL $ARLS009
ARLS009 ARISS Finalizes Plans for Silver Anniversary of Amateur Radio from Space

ZCZC AS09
QST de W1AW
Space Bulletin 009 ARLS009
From ARRL Headquarters
Newington, CT December 18, 2008
To all radio amateurs

SB SPACE ARL ARLS009
ARLS009 ARISS Finalizes Plans for Silver Anniversary of Amateur Radio from Space

The Amateur Radio on the International Space Station (ARISS) team is currently celebrating the silver anniversary -- 25 years -- of Amateur Radio operations from space. According to ARISS International Chairman Frank Bauer, KA3HDO, the crew on the International Space Station (ISS) has configured the radio to support cross-band repeater operations. They have also supported some SSTV downlinks and participated in a special test of 9600 baud packet radio operations on the simplex frequency of 145.825 MHz. After December 19, Bauer said he expects the ISS ham radio system to be on the 145.825 MHz frequency supporting 1200 baud packet. If PCSAT is configured during the week, he said double hop APRS is possible.

"During the week of December 21-26, we plan to support the cross-band repeater mode with a twist," Bauer said. "Our intent is to configure the radio for 145.99 MHz uplink -- including CTCSS tone of 67.0 and 437.80 MHz down. This will be performed in low power mode. We should also note that an extra-vehicular activity (EVA) is planned for that week -- Expedition 18 Commander Mike Fincke, KE5AIT, and Flight Engineer Yury Lonchakov, RA3DT, plan to perform a spacewalk on December 22. As per standard procedure, the ISS ham radio system will be turned off for the EVA."

Bauer said that from December 28-January 3, the cross-band repeater will be reconfigured for what he called "a special experiment. This will be a test of our L-Band uplink capability, which, to date, has not been proven out. Plan for an uplink of 1269.65 MHz and a downlink on the standard frequency of 145.80 MHz, using low power," he said. "Given the substantial cable losses of the L-band system, we hope some 'big guns' are able to penetrate through, keep up with

Doppler and make the connection."

A special certificate is being developed for those who communicate with the ISS from November 30, 2008 to January 15, 2009. This certificate will be awarded to those who have had two-way communications with the ISS on voice, packet (APRS) or through the voice repeater. Those who hear the ISS from space in any of the ARISS operations modes -- voice, SSTV, school contact, voice repeater or digital - will also be eligible to receive a certificate.

To receive the certificate, Bauer said to note the ARISS mode of operation (such as SSTV, voice or school) on your QSL and whether the contact was one-way (receive only) or two-way. "You should send your self-addressed, stamped envelope to the normal ARISS QSL volunteer distributor in your area of the world," he explained. "On the outside of the QSL envelope, please include the words '25th Anniversary Certificate.' Make sure your envelope is big enough to accept an 8.5 x 11 inch certificate and includes the proper postage."

If you do not know where to send your QSL, check the ARISS Web site to find the one that serves your part of the world.

"We will be sending your certificate to the volunteer distributors in bulk after the event is over," Bauer said. "This saves workload and money. So do not expect to see it until 1-2 months after the event closes on January 15." Bauer reminded hams that due to ISS flight requirements related to spacewalks and vehicle activity, the radio onboard the ISS may be off for some portion of this schedule. School contacts and general QSO opportunities by the crew will also preempt this schedule for short periods of time. "But remember that if you hear these," he said, "you still qualify for a commemorative certificate. Enjoy the ARISS ops on ISS!"

No, you still need the KPC2 firmware, but the last version to be
released was 5.0, which should have similar commands to other the other
devices that are running version 5 firmware.

5765. Re: Manually Place a Station on the Map

Yahoo group: APRS (2007 — 2010)
Date: 2008-12-19 13:42:07 UTC
From: usna71
Topic: 5757 Message: 5765

Ok, the stations are amateur stations. I understand that they can be made permanent in the database by using "Object permanence is indicated with the unique timestamp of 111111z in the object format" per http://aprs.org/localinfo.html but how do I put that data out there? I am sure there is an easy way I am missing, as I only think of it from a tracker standpoint and not from the database.

This way, we can see the fixed stations along with the moving stations anytime we fire up to support the event. We don't need to save the data with a specific computer with UI-View on it. Anyone's computer will show it.

From: Peter Loveall
Topic: 5757 Message: 5766

I don't know what Bob is refering to (maybe the "database" in his APRSDos application). I repeat, there is no APRS "database"; there are only independently operated databases either in individual clients or supporting web sites like aprs.fi, aprsworld.net, findu.com, and jfindu.net None of those databases provide for manual manipulation as that would defeat the real-time accuracy that they are depended upon to provide. All of these databases roll off most of their information over time.

As far as APRS object creation, this is done using an APRS client such as Xastir, UI-View, etc. They must be repeated by that client periodically or other clients (including most of the web sites) will not display the object locations after a period of time. Keep in mind that APRS-IS is processing over 2 million packets per day world-wide so there is no ability to make an object "permanent".

73,

Pete Loveall AE5PL

The "111111z" bit must be an APRSdos thing. We didn't implement it
in Xastir. I don't know whether other APRS clients implemented it.

In Xastir, when an object is initially created it'll get
transmitted at a short interval, then the interval lengthens after
each transmit until we hit a limit (which can be set via a timing
slider). After that, we continue to transmit the object at that
more lengthy period.

Get rid of the idea of a "database". There is no controlling
database for APRS. There's an in-memory and perhaps an on-disk
storage in each client for what each client has received and is
transmitting. Those databases apply only to the individual client.

There are web sites that may or may not have an attached back-end
database for what they've received across the internet, but that
database only applies to them and their displayed web pages, not to
anyone else.

If you want to see the specs and addendums, look here:

http://info.aprs.net

Under the "protocol" category. Much of the initial spec is present
in each client, some of the addendums may have been implemented in
any given client.

For specifics per client, visit here:

http://www.eskimo.com/~archer/aprs_capabilities.html

Although that doesn't try to go through the spec line-by-line or
anything, it's the best we have at the moment WRT a feature list.

> This way, we can see the fixed stations along with the moving stations

> will show it.

How long are your events that you plan for? Some of the APRS clients have the option to use "overlay" files, which may serve your purpose, but you'd of course have to distribute them to each computer which it seems like you wish to avoid. You could also distribute them on a site that all could get to, and just send a bulletin to all or a message to each containing the URL for downloading.

If you don't want to go with the overlays or with making a custom map, then creating the objects at ONE station and sending them out to all the rest, via RF or INET or both, may be your best option. When Xastir starts up it loads the previously-defined/still-active objects/items from a file and begins transmitting them.

Another thing to be aware of is how the objects/items are grouped during transmit. Xastir tries to randomize them a bit so that they all don't go out at once. Some clients do that, others don't.

I should also mention that other stations can take over the object,
changes it's parameters (other than callsign), move it, kill it,
etc. This is as designed for APRS. This means that you can have a
tactical display (or multiple) that every station involved in the
event can help to keep up-to-date.

Check out OpenAPRS.net

You'll have to create a account to be able to send to RF from my understanding. But they do have a OBJECT editor that will pass stuff for ya.

The other way to do it is with most other APRS apps is to send a object and as long as the application is running it will post the Objects you created. Most will allow you to click on the map and create a object based on where you clicked or enter a LAT/LONG data in the field for the object.

I don't think so. I have a KPC-3 (non+) and 8.2 was the limit, as I recall. To get full WideN capabilities for my digi I had to go to a KPC3+.

I haven't been to the site, but how can a web-based system "send to
RF"? Unless they've got a seriously huge RF infrastructure that no one
knows about?

5774. KAM won't send beacon

Yahoo group: APRS (2007 — 2010)
Date: 2008-12-26 16:48:55 UTC
From: Jan, LA2BBA
Topic: 5774 Message: 5774

Since some time, my Kantronics All-Mode doesn't send beacons from
UI-View any more. I have stopped the KAM, removed the power lead (and
re-connected it), and switched on again; I have switched the radio off
and later on again, no result. No sending. That means my fill-in digi
doesnt work, either.
Any advice with an as-it-seems not-speaking KAM? It listens all right.

Greetings and Happy New Year....
It has been a long time, mid 80's since I was on packet, but I seem to remember that there is a reset button on the circuit board that you can press to reset the Kam to it's original specs....
Also, the Kam, I believe, contains an internal lithium battery that you may have replace..

No, but the KAM is receiving OK, and I did some remote connection
maintenance at our digi via the KAM just a week ago (and the KAM must
have sent at that occasion)

I probably will have to check RS ports and cable and also open the
KAM, yes.
Oh, well.
There are a couple of more days to go before I go to work again, so
I'll have the time...

The computer doing the UI-View work (Win 2000 server) doesn't read the
weather station, either (another COM port) - I discovered that today.
So it might be the serial adapter, after all. (but where does it get
all the inbound traffic from, then? Strange).

Hi Jan,
There is a TX and an RX on each comm port the TX may have
died.

I have 6 TNCs here all working then 3 weeks ago my MFJ would not TX I
did a back track to the PC but no luck I replaced the RS232 no luck,
so I swapped TNCs around. My MFJ was at fault no TX but would RX ok.

Hi Hvaler

Sounds like your KAM is in KISS mode(or not), I've had a number of KAMs over the years, if it won't communicate via RS-232
I don't use KISS mode but some times it gets locked up in this mode, do a search in the manual for exiting KISS mode.
I had a program for getting it out of this mode, will see if I can find it for you.

It is in KISS mode, and I take it out of (and into) KISS mode via the
Comms setup in UI-View.
It is in KISS mode because that's the way it has to be for UI-View to
run as a digipeater.

>I don't use KISS mode but some times it gets locked up in this mode, do a search in the

I appreciate that!
However, it is not problematic to get it out of KISS.

A suggestion to stop the COM port from the device manager and restart
the computer worked.
Thanks for suggestions!

The easiest "Plug and Play" system is the Kenwood 710 and the
AVMAP G5 GPS. The GPS comes with an internal antenna that
I found to work very well inside both my Tahoe and Motorcoach.
Most dealers offer the pair with a discount.

Thanks for the referral! If you are interested in a transceiver (tracking, and digipeating) You might also check out our new Micro-Trak TT4: http://www.byonics.com/microtrak/mt-tt4.php I pretty much designed it with SAR in mind. It can upload waypoints to your display GPS, or use your PC with mapping software, and/or use an LCD display.

I would also recommend the Kenwood D-710A and the AvMap Geosat 5 combination. It's pretty much "plug n' play" and you can "zero in" on any HAM APRS operatoot who appears on your screen.

Agreed. This is arguably the ultimate APRS setup up out there.

Easy to set up and learn, a bright 5" touch screen, and I believe one of the only commercial GPSRs, that is APRS friendly out-of-the-box.

However, you get what you pay for...add a good antenna and coax, and you're at $1200+. ;)

73, and happy new year.

The AvMap isn't the only game in town.

I use a Garmin GPSmap 276C that I bought as a factory refurbished unit for $399 (I now see them online for $349). I use it with either my Kenwood TM-D700 or Argent Data T2-135 to track APRS objects on the map screen of the GPS.

Scott Miller at Argent Data has also adapted the Tracker2 APRS units he builds (OT2m and T2-135) to the Garmin Nuvi 300 and 600 series through the Garmin FMI interface. You can then use the Nuvi to send and receive messages via APRS as well as track APRS objects on the map screen.

Bob...

5790. APRS Part 97 compliance?

Yahoo group: APRS (2007 — 2010)
Date: 2009-01-01 22:52:04 UTC
From: Christopher K. Greenhalgh
Topic: 5790 Message: 5790

I run APRS in my car, and have it wired to power up with the ignition switch. I lent my car to my daughter (she knows about it) and was talking on the local repeater from home. A fellow ham heard me say I was at home, and chimed in. He said he saw my car tracking on APRS, and I informed him of the situation.

His position, was that I may be in violation, as I was not present with my daughter. I told him it was my position, that she was not "operating", and that the station was "automatic" and fell under the "unattended operation" requirements. He said if that was true, I had to have a means to "remotely control" the station. Good point, but it just so happens the TNC is a T2-135, and is set up so I can connect, and "control" the station remotely. So everything is fine...I guess.

But that raises some other questions about unattended operation. I know there are APRS digi stations running unattended...some without remote access. I also track balloons, which I know for fact are not capable of remote access.

Comments and/or opinions?

The way you have it setup is fine. This question has come up time and time again. I provide support for a rather large event out here and someone contacted Riley over the way we did it. Last year I received a call from Riley and was cleared on how we did it.

Topic: 5790 Message: 5793

This comes up frequently in the APRSSIG. I think the general consensus
is that if you can call up the driver on the phone and tell them to turn
off the tracker, that counts.

Maybe you are also supposed to listen to the
frequency your remote transmitter is using,
to detect that it needs to be shut off ??

In your paragraph you commented on 2 different situations.

Running APRS with your call sign transmitting at least
every 10 minutes unattended would be legal if you were
not there.

But you made the comment that your daughter was talking
on the local repeater.

Talking would not be digital mode it would voice mode.
so with that said if your daughter is not a ham operator and
was using voice on the local repeater and you were not present
at the control point. Then yes you would be in violation and if
the local repeater belongs to a club or another ham radio operator
they could if they want to ban you from the repeater for allowing
such activity.

Do not mix the 2 rules of DIGITAL and VOICE communications
they are 2 different animals.

Subject: [APRS] APRS Part 97 compliance?

I run APRS in my car, and have it wired to power up with the ignition
switch. I lent my car to my daughter (she knows about it) and was talking on
the local repeater from home. A fellow ham heard me say I was at home, and
chimed in. He said he saw my car tracking on APRS, and I informed him of the
situation.

His position, was that I may be in violation, as I was not present with my
daughter. I told him it was my position, that she was not "operating", and
that the station was "automatic" and fell under the "unattended operation"
requirements. He said if that was true, I had to have a means to "remotely

control" the station. Good point, but it just so happens the TNC is a T2-135, and is set up so I can connect, and "control" the station remotely. So everything is fine...I guess.

But that raises some other questions about unattended operation. I know there are APRS digi stations running unattended...some without remote access. I also track balloons, which I know for fact are not capable of remote access.

Nope Nuvi 350 can be used for aprs as well and far less than AVMap in cost Scott has been using it on his OT2M with good results and doesn't have you spend a fortune on a GPS.

The AvMap isn't the only game in town.

I use a Garmin GPSmap 276C that I bought as a factory refurbished unit for $399 (I now see them online for $349). I use it with either my Kenwood TM-D700 or Argent Data T2-135 to track APRS objects on the map screen of the GPS.

Scott Miller at Argent Data has also adapted the Tracker2 APRS units he builds (OT2m and T2-135) to the Garmin Nuvi 300 and 600 series through the Garmin FMI interface. You can then use the Nuvi to send and receive messages via APRS as well as track APRS objects on the map screen.

As far as I know, Scott's Opentracker is the only unit to support the Nuvi's fleet vehicle interface. This will pretty much rule out using it with a Kenwood Radio or other encoder/decoder (TinyTrak, etc.) Scott was talking about building a converter interface to allow the Garmin to at least talk in NMEA standard sentences, but I am not sure if that project progressed. I really like my Avmap, big screen, video capability, loud audio prompts for noisy environments,and it speaks our language: NMEA serial data.

Mike, my understanding is that the RF decks are the same between the TM-V71 and the TM-D710. The different features between the two radios are in the control head. Based on what I've read elsewhere, you can effectively turn a V71 into a D710 by replacing the stock V71 head with the RC-D710.

I have a V71 and have considered either swapping it out for a D710 or getting the RC-D710 head, so I'll be interested to see how it works out for you.

I'll let you know. Looks like everybody (including my favorite vendor Gigaparts) is out of the RC-D710 for now, but I'll probably order next week. I thought about just getting the D710, but the difference in price between the new radio and the upgrade is significant and I really DON'T need another dual band radio, so I'll just suck up the cost of the upgrade.

73,

Mike

Most likely it's a Mic-E formatted packet, which could be sent by a D7, D700, D710, a TinyTrak of some type, or even a TAPR Mic-Encoder or Pic-Encoder.

Mic-E format uses the destination callsign field to send a compressed version of the latitude plus the 100's digit of the longitude. The rest of the information is in the INFO portion of the AX.25 packet.

As you see the station move around the U1RRWT might change into U1RRWU or U1RRWS or similar as the latitude changes.

There's another indicator as to whether it might be a Kenwood. In the INFO portion of the packet there's a "'" or "`" character at the start. One of those was the original spec character indicating a Mic-E packet. The other one was what Kenwood erroneously used for their Mic-E packets, so the spec was changed to accommodate it. If a station uses the wrong one, it's a Kenwood. The spec will show you the specifics.

5807. WinAPRS

Yahoo group: APRS (2007 — 2010)
Date: 2009-01-03 16:41:01 UTC
From: Mike Besemer (WM4B)
Topic: 2720 Message: 5807

Hello all,

At the recommendation of a friend, I've downloaded WinAPRS and have it running on my desktop (Vista Home). It is unregistered at this point, since I want to try before I buy. I have Tiger Maps installed for the entire state of GA and can see stations on my map.

I'm currently using a TCP/IP connection through aprsfl.net, and see lots of traffic at the bottom of the Maps window. The problem I have is that my station (currently WM4B-2 for testing purposes) is not showing up on the Internet (ARPS.FI). It's been running on and off for 24 hours now and nothing shows up. I've tried other TCP/IP servers as well with the same result? What am I missing? My station shows up fine in the WinAPRS Map window.

Also, I keep seeing a message at the bottom of the map window that says I'm out of memory in the station list. Is that normal? Can I filter so I only see stations within a certain radius of myself? (I think UIView allows this... I know that one of the other programs I use does.)

Basically, I'm a noob looking for advice/assistance. Thus far, I haven't found the answers in the documentation.

Thanks,

Mike

It's basically done. Production has been dragging along due to supply problems and such, though. I'm using a new distributor for the processors, and a new contractor to do the MCU flash loading and re-taping, and a new contract manufacturer for assembly since my other CMs couldn't reliably handle the tiny QFN parts.

Add too many new elements at once and nothing ever goes according to schedule, especially around the holidays. If I could reliably assemble these things in-house I'd be shipping them now, but it's just not practical.

The next time you send out a packet, check:
http://www.findu.com/cgi-bin/errors.cgi

If you find your packet there, check it against the Standard and try
to figure out why it won't go through.

As you haven't registered, you probably don't have an APRS Validation
number, either.

>I'm currently using a TCP/IP connection through aprsfl.net, and see lots of

You are (probably, still) missing the validation number, which will
work as a "password" for your packets to be received by the APRS
Internet system.

5813. qAo from my IGATE

Yahoo group: APRS (2007 — 2010)
Date: 2009-01-05 14:00:36 UTC
From: usna71
Topic: 5813 Message: 5813

Hello. I am running an IGATE using UIView and noticed something odd.
I was watching a car go by and copied the following from aprs.fi. My
IGATE station ID is KB1MOV. I noticed that many of the other station
ID's for KC2MYD were qAR but I am qAo. According to

2009-01-04 16:46:27 UTC:
KC2MYD-14>T3SY7V,WIDE3-3,qAo,KB1MOV:`d2b!^nu/]"6B}Try me on 146.520

2009-01-04 18:05:09 UTC:
KC2MYD-14>T4RS3U,VE2RAW-3*,qAR,VE2PCQ-3:`dTa!|mu/]"57}Try me on 146.520

According to <http://www.aprs-is.net/q.aspx>
"qAo - (letter O) Packet was received via a client-only port, the
FROMCALL does not match the login, and the packet contains either a ,I
or qAR construct where the indicated IGate matches the login."

So, my question is, do I have a login problem on my UIView IGATE?

Thanks and Happy New Year,
Bill
KB1MOV

> So, my question is, do I have a login problem on my UIView IGATE?

Hi Bill,

If your IGate is connecting to port 14580 on either the aprs2.net or aprs.net servers, you do not have a problem. If, on the other hand, you are connecting to a specialty port on a server that is used, for instance, for SATGates (one-way gateways), then you want to switch to port 14580 if your IGate is bidirectional.

This construct was put in originally to cover all server-filtered ports to help identify filtering issues that might have been in the server software. However, later releases of javAPRSSrvr (the only software implementing that construct) only set that construct for ports that do not keep track of stations heard (a necessary component for a bidirectional IGate). Because of this, some servers are still running software that will set that construct even on a fully functional IGate port like 14580. Like anything, we can't force people to upgrade software so that will probably continue to be an issue going forward.

73,

Pete Loveall AE5PL

Hi,

I've been searching the internet hi-and-low for a list/explaination of APRS TOCALL addresses. I found one dated May 2007. I'm starting to use UISS with GPS Module. It's sending APRS POSIT's to APEG03. I can't change it and just wondering what the APEG03 means. Could someone explain? Thanks for your support.

The variations of AP* TOCALL addresses are the device's (or the APRS client software's) interpretation of the generic APRS destination address. Your APRS client will make APEG03 of it, my UI-View client makes APU25N. There is a list somewhere, I haven't been using time to look for it; I'm merely accepting the fact :-)

The nuvi 350 will work with my Tracker2 (and do text messaging with a nicer display than the D710). I've also got my converter cable for the nuvi coming out soon (it's in beta testing now and waiting for production to start) that'll let it work with the D700 and D710, but without text messaging.

The nuvi 350 is discontinued, but you can still get it for around $180 or less.

As far as I know, Scott's Opentracker is the only unit to support the Nuvi's fleet vehicle interface. This will pretty much rule out using it with a Kenwood Radio or other encoder/decoder (TinyTrak, etc.) Scott was talking about building a converter interface to allow the Garmin to at least talk in NMEA standard sentences, but I am not sure if that project progressed. I really like my Avmap, big screen, video capability, loud audio prompts for noisy environments,and it speaks our language: NMEA serial data.

The AvMap isn't the only game in town.

I use a Garmin GPSmap 276C that I bought as a factory refurbished unit for $399 (I now see them online for $349). I use it with either my Kenwood TM-D700 or Argent Data T2-135 to track APRS objects on the map screen of the GPS.

Scott Miller at Argent Data has also adapted the Tracker2 APRS units he builds (OT2m and T2-135) to the Garmin Nuvi 300 and 600 series through the Garmin FMI interface. You can then use the Nuvi to send and receive messages via APRS as well as track APRS objects on the map screen.

Yes, it supports input in both GPWPL and PKWDWPL (D710) format. Only
the nuvi 350 properly displays the waypoints, though. Others ignore
them entirely or create duplicates each time a waypoint moves.

>Please explain. I've never heard of this. I operate APRS mobile (RF) and
>also via TCP/IP using Xastir and UIView and all my packets appear on the
>internet. I must be missing something here.

As you said you weren't registered, I take it you have no validation
number which is needed for getting into the APRS-IS. That number has
to be entered somewhere in your APRS application in order to let the
APRS Server that you connect to accept your packets. The validation
number is calculated based upon your callsign.

You were referring to WinAPRS (see subject line); I don't know how
that application is set up. I also can nothing bout the setup of
Xastir. But in UI-View, the validation number is entered by the user
in Setup - APRS Server Setup.

Just now, your packet (as seen by FindU) is:
||Raw packet: WM4B>APU25N,TCPIP*,qAC,T2APRSFL:=/>%hg9A"G- BKathleen, GA 146.85 No Tone
{UIV32N}
As it says APU25N, I see that you were using UI-View 32; and the part
TCPIP is telling me that you in fact do have a validation number
entered in UI-View (unvalidated packets would read TCPXX; I haven't
seen any on findu or aprs.fi, but I every now and then see them on my
UI-View map display). That number is the same regardless of your APRS
application.
The need for a validation number is when you connect to the APRS
server directly.

I commented based upon your description from jan 3rd:
>>I'm currently using a TCP/IP connection through aprsfl.net, and see lots of
>>traffic at the bottom of the Maps window. The problem I have is that my
>>station (currently WM4B-2 for testing purposes) is not showing up on the
>>Internet (ARPS.FI).

From: Fred VE3FAL
Topic: 5829 Message: 5829

Hello from Thunder Bay Ontario where it is -20.C and -28C with wind-chill this evening.

My name is Fred, my call is VE3FAL and my GRID is EN58hh...

I am active on VHF APRS and am currently experimenting with HF APRS on 30 meters.

I will be running a station on 30 meters this weekend and see what I can find using this mode as I hope to use it when mobile in Northern Ontario when out of repeater range for VHF APRS..

Have a great weekend one and all.

Fred

From: Fred VE3FAL
Topic: 5830 Message: 5830

Ok I have AGWPE and AGW Tracker up and running using a signalink and hooked to my FT-857.

Frequency is 10.151 LSB.

I can transmit ok and I hear other stations on frequency but I am not picking anyone up on my screen.

I am set at 300 baud for both transmit/receive on the AGWPE.

I use the same setup for APRS on VHF and it works 100%....

Anyone else use these programs for this use and have any ideas?

Fred

Hi Fred,

Good to see you here! Did you set up to use the KAM or the AEA/PK232
tones? That can make much difference. Also, try tuning from the other
sideband.... I use 10.1476 MHz, DIG mode (using the DIG plug in the
back of the radio) (you can do same with USB and mic audio) on my
FT-817 and the KAM tones. I use a SignaLink USB. Software is AGWPE-Pro
and AGWTracker and the seetup works fine.

5832. INFO Kiosk

Yahoo group: APRS (2007 — 2010)
Date: 2009-01-24 16:03:15 UTC
From: Rusty
Topic: 5832 Message: 5832

I've installed InfoKiosk and set it up with local nets, repeaters, etc.

Once it was installed a object appeared (INFOKIOSK). Several days later, I observed objects for some of the repeater locations, club meeting, but not all of them. Many of the repeaters are at the same location, so I wold expect a problem with those objects.

The objects appear, but appera to be sent only once and do not remain.

Should there be objects for all entries in InfoKiosk?
Should they appear only once and then expire?
Is there any way to indicate which ones should apperar and their timing?

Rusty K1GGS

From: Rusty
Topic: 5832 Message: 5833

I just stumbled upon the question to my own question...

The objects are "posted" when someone queries the Kiosk. e.g. if i
query ?440rpt, it send me the listings, and send an object to the map
on the position of the repeater.

Great

Is your AGWTracker registered? If not, you probably need to register it for the software to log in using a valid passcode. Packets from non-validated clients are no longer accepted by APRS-IS (messages have never been accepted from non-validated clients).

You might want to take this to the AGWTracker support group for further help.

Hey folks-

I am about to acquire a used Asus Eee pc 900 (for a very good deal) and would like to set up an APRS client on this machine for both home and portable use with my TH-D7. I currently use (and have been for some years) UIView 32, but I'd like to explore other client options. I don't really like the PMaps map server though I use it on my machine now. I'll probably just make maps from topos for my areas of interest.

The Asus only has a 12 Gb SSD and is running Win XP. What are your experiences with USA Photomaps, Xastir, etc? Anybody have an Asus Eee PC on which they run APRS?

The THD7 and UI view on the ASUS 710 works very well.
The 710 was a linux machine, but now has a reduced XP
version running nicely.

With the larger capacity, you shouldn't have a problem.

73, Dave.

You connect the GPS to the GPS jack in the TH-D7; this will feed the
PC and UI-View as well.

But can't be a USB GPS in that case. A USB adapter won't help you
there.

I've had reports that Xastir runs on it. You'd probably want to
install Linux & Xastir on another card and boot from that or replace
the OS with Linux. I doubt you'd be all that successful with Xastir
on Cygwin/WinXP, or Xastir running inside a VMWare Linux image with
that setup.

I do understand that a USB GPS won't work with the D7- I've been using a Garmin Foretrex with the D7 for 3 years now. I've never used that GPS connected to the D7 with UIView, but it sounds like it will work- I didn't know the GPS data would port through to the PC.

According to G4IDE (SK), that will work. Easy to check; just connect
the TH-D7 to the PC, and see. At least, I do think I have done that
with a _real_ serial port in the PC.

The D7 is a three wire (TX,RX,Gnd) device so this has nothing to do with being a real serial port, fake serial port, USB serial port, or a FSM (Flying Spaghetti Monster) serial port.

The only thing that matters is that the command GPSTEXT is in the configuration file and is given a parameter for an appropriate GPS NMEA sentence.

The better choices would be:

GPSTEXT $GPRMC (contains speed but no altitude)
GPSTEXT $GPGGA (contains altitude but no speed)

Unfortunately you can't have both speed and altitude at the computer using the pass-through mode of the D7. It is limited to one sentence. I've tried using shorter prefixes (like just $GP) before but the D7 ends up passing only one or two of the many sentences because of the way the pass-through is implemented.

Whatever you say.
I was merely trying to say that I have tried it with a real serial
port, and not with a USB-Serial adapter.

Some devices are picky about timing, so the USB adapter thing is a valid point. Some of those things just have too much latency. For the D7 it shouldn't matter, though.

From: Reg
Topic: 5856 Message: 5856

I was active with APRS back in the days of DOS, UI-View16 and UI-View32 at home. In the car I used my Kenwood D700 and D7 when portable.

I've been absent from APRS for some time, but now want to return. I'm interested in travelling throughout the UK, where I live and the rest of Europe.

I still have my Kenwoods, but what software is best? UI-View32, APRSPoint or another? With the loss of Roger, who lived not far from here, UI-View is now unsupported, whereas APRSPoint is well supported.

I want a program that will run on an XP laptop.

I use OziExplorer, with a large collection of maps and although the development version has a little Automatic Ship Identification (AIS) support and APRS is mooted as coming, It's not suitable - yet!

Any suggestions and ideas would be most welcome.

Reg

Hello all,

I run an IGATE (N0SPB) in the Denver area, it has been running on a D700 using UI-VIEW. I decided after two years it was time to give the radio a brake and moved it over to a DR135T /EMk II which turns out to have a better receiver then a two year old D700.

After this change I seem to have run in to a strange problem. Every 16 or so hours I have to restart the radio and have UI-VIEW resend the START KISS command. If I do not do this the TNC seems to stop decoding packets, it will however still send them.

If anyone knows a fix I would love knowing what you did.

Thanks
Shaun

I run UI-View with PMaps on an ASUS Eee PC 900. Its connected to a KPC3+ via
a USB-to-serial (DB-9) adaptor, and everything runs fine.

However, my 900 has a 160gb hard drive.

Subject: [APRS] APRS client for Asus eee pc 900

Hey folks-

I am about to acquire a used Asus Eee pc 900 (for a very good deal)
and would like to set up an APRS client on this machine for both home
and portable use with my TH-D7. I currently use (and have been for
some years) UIView 32, but I'd like to explore other client options. I
don't really like the PMaps map server though I use it on my machine
now. I'll probably just make maps from topos for my areas of interest.

The Asus only has a 12 Gb SSD and is running Win XP. What are your
experiences with USA Photomaps, Xastir, etc? Anybody have an Asus Eee
PC on which they run APRS?

At the risk of opening this can of worms again, there is a known bug in UI-View that causes delays, or completely ignoring packets marked to digi (or igate out), when running in KISS mode.

I have done a lot of investigation into this...reinstalling UI-View, changing PCs and TNCs, and the only regular common denominator, is that it tends to happen on a "busy" station. What is surprising in your case, is that this started when you changed TNCs, yes? What TNC were you running before? Were you running in KISS mode then too?

And the fix for most is to restart in KISS mode, whether it be restarting UI-View, or reinitiating the TNC...like you said. A lot of guys just accept this bug, and write scripts, or even schedule UI-View to "restart" under Windows scheduler, like at 2:00am, but you said yours was about every 16 hours, so something more may have to be done on that front.

With all that being said, I'm not saying your TNC may not have a problem, but with the source code destroyed for UI-View, it makes it more difficult to troubleshoot this known issue.

Dunno if this is correct or not, but:

I have heard many people complain about that tnc, and hear that is why
many people switch to using the tracker2 in that radio instead of the
one from alinco. But since I haven't played with it myself, I'm not
going confirm it.

Doesn't APRSPoint require M$ MapPoint (pricey)?

I still prefer UIView32. Well written software doesn't need support.

I can't say anything about e.g. APRSPoint, but UI-View32 is supported
by the users via the yahoo! group, where you will find (in the
archives) G4IDE's own advice as well as other users' help and support
messages; both archived and fresh.

5866. APRS with AvMap Geosat 5 or Garmin

Yahoo group: APRS (2007 — 2010)
Date: 2009-02-06 00:05:16 UTC
From: kb6nyu
Topic: 5866 Message: 5866

Hello-

I'm trying to come up with the best vehicle/mobile APRS tracking solution for chase-vehicles for balloons and hang-gliders.

I have used notebook PC systems running APRS+SA (Street Atlas) and a Kenwood TM-D700, but these was built before Garmin PND's became so ubiquitous. So I'd like to use something that takes up less room, and can be hidden from the smash-and-grab crowd, such as a Garmin 700 or 7000 series, or AvMap. I've already thought of how to hide the display-box of the Kenwood TM-D700.

I'll be using Byonics's AllinOne on the Aircraft to be tracked.

I also need:

RealTime Traffic (not too much traffic out in the desert, but it's sure handy to work around the get-away weekend traffic when heading out or returning from the desert)

MP3 player with line-out for line-in connection to the car-stereo (yes, I think the chase crew should be able to listen to their music :)

I'm willing to consider a fee-based Traffic Service like FM Traffic or XM-radio, but it looks like either the AvMap of a Garmin would use the solo serial port for a traffic reciever, which I also need to connect to the APRS radio.

There may be a Garmin with an internal FM Traffic reciever, but I also need:

GPS Tactical Display: Filters all callsigns except the 1 or 2 that need to be tracked.

Tactical Display shows location and altitude of filtered/tracked callsigns.

Has anyone else been sucesfull in building a system that fulfills these requirements?

Thanks

GPS's won't be able to display the altitude, it's just not supported
by the nmea protocol gps's use.

As for filtering, that is probably going be a limitation of the tnc
you use, I am not positive if the d710 will filter it's output to the
avmap/garmin/... or not.

The avmap will display altitude when used with a tm-d710, but it's
altitude is limited to 20k meters or so, if I remember correctly, or
maybe it was 20k feet. I forget if this was a tm-d710 issue, or avmap.

As far as traffic goes, avmap doesn't support traffic in the usa, at
all, and you can't do traffic and aprs at the same time.

Not entirely true. Magellan serial units will do it, Garmin units in Garmin binary mode (when used with the Tracker2), and new Garmin units like the Colorado 300. They all use proprietary sentences (or a proprietary protocol in the case of the Garmin binary mode.)

I used a GPSmap 60cs to chase my balloon across the Mojave desert. Here's a screen shot of the waypoint detail, showing course/speed, temperature, voltage, altitude, and rate of climb:

http://n1vg.net/balloon/waypoint.gif

I can't recall if the Garmin kept showing the altitude properly all the way up. I seem to remember that it got stuck at some point.

Subject: ARRL/TAPR 2008 DCC Video Set Now Available:

ARRL/TAPR 2008 DCC Video Set Now Available:

The ARRL and TAPR Digital Communications Conference? was a three-day conference held in late September near Chicago. It featured twenty-one presentations from hams on the leading edge of digital communication, including D-STAR, a variety of programs for packet, Winlink2000 and advanced Software Defined Radio.

ARVN:Amateur Radio//Video News captured every minute of the presentations on video,* and now offers them on six DVDs in high quality video and audio. You can order by credit card or PayPal at www.arvideonews.com.

The presentations are grouped on the six DVDs in as logical an order as possible (listed below). You can buy the DVDs individually ($15/ea,plus $3 shipping, $4 international).? Or get whole set for $75 (plus $3/$4 shipping). The complete set saves you $30 over buying them individually, after shipping cost.

Here's how the DVDs are laid out:

DVD 1: Packet

* Nick Luther K9NL ? Weather Data Distribution over AX.25. Thought 1200 bps packet is too slow for images? Nick makes it work.

* John Blowsky KB2SCS ? EcomSCS and GatewaySCS "real e-mail clients" for Packet Radio mail.
* Paul Wiedemeier KE5LKY ? UDPcast for IP Multicast over Packet Radio. Better data distribution to multiple stations.

* Eric Westgard NY9D ? It's the Network: Minnesota Packet/D-STAR Data Network. DVD 2: Software Defined Radio
* Matt Ettus N2MJI ? USRP2 Universal Software Radio Peripheral.
* Paul Rinaldo W4RI ? SDR Outlook. The regulatory environment for SDR.
* Scott Cowling WA2DFI ? HPSDR Update. How HPSDR, TAPR, and AMSAT work together to develop cutting? edge technology, and where things stand now.
* Jerry Shirar N9XR ? Clocking the Data. How crystals and the Pierce oscillator work to stabilize your digital project.
DVD 3: Winlink 2000, D-STAR, APRS

* Victor Poor W5SMM ? Winlink 2000 Update. A complete rebuild to better handle emergency communications.
* Rick Muething KN6KB ? WINMOR, a sound card mode for Winlink. Performance rivaling Pactor II and III; far less expensive.
* Bob Bruninga WB4APR ? APRS Initiatives Since 2004. There's lots more to APRS than position tracking, and Bob has big plans!
* Pete Loveall AE5PL ? D-STAR Uncovered. How D-STAR really works, from one of the K5TIT guys. DVD 4: AMSAT, Publishing

* Steven Bible N7HPR ? SuitSat 2 Update. SuitSat 1 was a rush project, literally "pushed out the door." SuitSat 2 will be a real satellite with serious capabilities.(It'll be pushed out the door, too.)

* Tom Clark K3IO ? AMSAT Eagle GEO. Tom's proposal for a geosynchronous Amateur Radio satellite.Hint: 1200 MHz is now practically DC.

* Larry Wolfgang WR1B ? Writing for QEX, QST. You've developed a great project. Now get paid to tell the world about it.? Here's how.
* Joe Lynch N6CL ? Writing for CQ, CQ VHF. A little bit lighter side of technical writing. DVD 5: Introductory Sessions

* Mel Whitten K0PFX ? HF Digital Voice. A good grounding in WinDRM, FDMDV and the AOR modem digital voice modes for HF.
* Mark Thompson WB9QZB ? D-STAR Voice and Data. Answers your questions on how to operate D-STAR.
* Pete Loveall ? DPRS. Pete wrote DPRS to better utilize the GPS and low-speed data functionality of the DV mode. ICOM makes direct use of it in the newer radios.
* Dan Smith KK7DS ? D-RATS. Dan wrote D-RATS to make D-STAR low-speed text chat multi-platform. Then he threw in the kitchen sink. DVD 6: Sunday Seminar

* Phil Harman VK6APH ? Software Radio "Through the Looking Glass."? This is the full morning presentation of how the HPSDR Mercury receiver was developed. Mercury places the A/D converter at the antenna (after only a band-pass filter). So everything is done in software. Phil says performance is as good or better than the high-end commercial analog receivers.
Again, you can order the DVDs individually, or get the whole set.? www.ARVideoNews.com?

73,
Gary KN4AQ
Producer

* The "D-STAR Night" presentations are not included. That content is similar to the 2008 Dayton Hamvention D-STAR Meetings?, avaialble on DVD from ARVN. Tom Clark's talk at the DCC Banquet is also not included.

5872. Re: [APRS] ARRL Executive Committee wants your laptop defined as a cell phone !!

Yahoo group: APRS (2007 — 2010)
Date: 2009-02-07 03:57:03 UTC
From: David Bruce
Topic: 5869 Message: 5872

Mike;
This was discussed at the last executive committee and published in February's QST.
The reasoning behind this is to prevent state legislatiures from looping Amateur Radio into the net of imposing a ban on cell phones while operating
a motor vehilcle some states have been discussing this and the way some of the legislation is written it would involve all communications's devices not just cell phones.

The best bet is to contact your state legislative rep from the ARRL and make sure that this is not happening where you live.

5873. Re: APRS with AvMap Geosat 5 or Garmin

Yahoo group: APRS (2007 — 2010)
Date: 2009-02-09 17:25:27 UTC
From: kb6nyu
Topic: 5866 Message: 5873

Thanks for the feedback on my original post.

Thanks to the guys at HRO in Oakland, CA I got a hands-on demo of an AvMap Geosat 5 and Kenwood TM-D710A.

Unfortunately, I wasn't able to filter all of the incoming APRS traffic on either the TM-D710A or the Geosat 5. I was able to create a route to a specific callsign, the the map display quickly fills up with local APRS activity...not too useful as a tactical display.

5875. Re: OT2 and Icom 2100

Yahoo group: APRS (2007 — 2010)
Date: 2009-02-14 08:05:18 UTC
From: Mike Morris WA6ILQ
Topic: 5874 Message: 5875

Anyone here using the combination of an OT2 and an Icom
IC-2100 successfully?

I'm a newbie to the APRS world, so please be gentle...

The radio is a Icom 2100 that will be mounted in a 20mm
ammo box
along with a gell-cell or two and an OT2. The
intent it to have maximum durability (hence the steel can),
along with maximum flexibility.

The design will allow use as a self-contained tracker with
at least a days worth of battery, and as a portable base
station for use at public service events.

I do not have the Icom 2100 in my hands yet, so I do
not know what the interface to it is (yet).

The owners manual says there is a couple of spare pins
on the mic jack, the service manual shows those in use.
Both are available on the Icom page at
<http://www.repeater-builder.com/icom/icom-index.html>.
Can anybody clarify that? I was thinking about putting
COR and non-volume-controlled audio on the spare pins
to make connections to the OT2 easier and to not require
the speaker jack.

If you have any info on hooking up the OT2 / Icom 2100
together I'd be grateful for a copy.

Lastly, I want to use the OT2 DC power control to control
the DC power to the Icom. This will stretch the life of the
gell cell while in tracker mode.

I was picturing having a toggle switch on the panel inside
the ammo can that has three positions: center off, then one
direction connects the power directly to the radio (portable
base station mode), and the other direction routes the
power through the OT2-controlled power relay (tracker mode).

Is all of the above feasible?
Or is my lack of knowledge and experience showing?

What else should I be asking that I am not ?

BTW the first real deployment of this tracker box will be the
Baker-To-Vegas race.

Ken,

I am a relative newcomer as well. I found the following document to be the best starting point:
http://www.aprs.org/doc/APRS101.PDF
The APRS.org web site has much more information that is very hard to get your head around until you have tried to make sense of that document.
One year later I am still asking stupid questions and people have been nice about answering.

Suppose I didn't care that waypoints made it back to the GPS receiver,
would this cable work with other model Nuvi receivers for sending the
NMEA data back down to the radio?

As it has been interpreted several times in the case of mobile trackers when non hams are driving, I'd say you are ok as long as you take measures to ensure the non ham does not use the transmitter and have some way to stop transmitting if there is a problem.

This could be as simple as telling "dad" not to touch it unless you need him to turn it off.

I say go for it.... assuming the APRS network could use another digipeater in the area of your father's house.

John,

Well, I do not know all the answers, hell, I don't even know all the questions.. hi hi hi

Well, they have digi's set up in all kinds of places. The Findlay club has one, it is unattended, runs on automatic...

At one time, like fm repeaters, you had to have a way to shut the TX off in case of a problem. I know that was then, I bet now, most just run..... some have and some do not have a control op...

Randy, wd8ejc runs a digi in Lima on the Time Warner location. He also runs a digi and a iGATE at his house, so you may want to ask him if you have to do anything special....

Is your father have a good location for a digi? what is your reason?

73,
Stan

Right, it won't show anything that you don't see now. The D710 sends more information.

If you get the converter cable for the nuvi 350, you can always get a Tracker2 to go with that GPS III+ on another radio - the display's not the greatest, but with the T2 it'll show the symbol and the first 20 characters of the status/comment. The GPS III+ was actually better that way than some of the later ones like the eTrex series - those didn't have any comment display at all.

As far as I know, as long as there's a CONTROL OPERATOR who has the ability to shut off the transmitter in case of a problem, you should be okay.

5891. Running APRS on 144.390 and 145.825 (ISS)

Yahoo group: APRS (2007 — 2010)
Date: 2009-02-19 23:17:01 UTC
From: Matt
Topic: 5891 Message: 5891

Howdy, folks.

I'm currently an APRS igate on 144.390 from home. I'd like to also run an igate for traffic from the ISS. I'm using UI-View32 for the normal igate, but I can't run two instances of UI-View32. What other program can I use that will suit this need and isn't a resource hog? I won't be doing any transmitting, strictly receiving.

Thanks!

Matt, WX4MET

Hi Matt

My first question is why you want to run two instances of UI-View32. If it's to allow you to monitor two separate TNCs then using AGW Packet Engine will allow one instance of UI-View32 to connect to multiple TNCs. If there's another reason, they the answer is to simply copy all of your UI-view32 files from the standard directory to a second directory. You can then launch uiview32.exe from each folder. Since each uses the INI and XTR files from the folder that the EXE was launched from, they will quite happily coexist. You'll also want to set a different SSID on each instance on UI-View32. I've been using AGW Packet Engine and 4 instances of UI-View32 on my VE5BNC-3 IGate for several years. In case you're wondering, the reason I runs multiple instances is because I use each to generate different map views for my UI-Webserver.

From: Rick Garrett
Topic: 5894 Message: 5894

Hello, all! I'm new to APRS and need some help figuring out what I really need.

I'm looking for something rather compact, as I want to use it both mobile, and on my bicycle.

I already have a mobile radio, HT, computer, and GPS. (Etrex)

I've looked at some of the trackers, but I want the ability to receive also, but just transmit. That's why I'm shying away from the Byonics AIO unit...it certainly looks like a nice unit, but it's a transmitter only. Plus, since I already have radios and GPS...it seems like overkill.

Since some of the use will be on a bicycle weight and size is somewhat of a concern.

It appears to me that Byonics and Argent Data, but I may be missing something. The ArgentData Open Tracker+ looks to me like the closest thing I'm looking for. I'd need a cable for my radio and GPS, and be pretty well set.

Suggestions, anyone?

Hi Rick,

Not really what you want (no rx, and integrates a bunch of pieces you
already have) but this is the smallest, self contained 5 watt unit
around.

Hi Rick,

The OT1+ will work. The Tracker2 works even better with the eTrex -
it's able to set waypoint symbols (there's no comment field on the eTrex
unfortunately) and altitudes. If you want something small and
integrated, I've got a new T2 transceiver combo in beta testing:

https://www.argentdata.com/catalog/product_info.php?products_id=112

You can actually crank it up to more than 9 watts, even though it's
rated at 5. The receiver also beats my DR-135T for sensitivity by
several dB.

I've got some prototypes here in the office with a T2-301 and battery
pack in a waterproof case (Underwater Kinetics 207) but I don't have
those ready to go yet, and you could probably come up with a more
compact bike mount.

From: GERALD THOMAS
Topic: 5897 Message: 5897

I am not sure why you want to run two seperate APRS stations unless you want to monitor two seperate freq.'sat the same time on seperate computers. there are several programs you can use such as [UI-View 2.39] it is a 16 bit version of UI View 32.also u can try [Win APRS]. a stingy version that will save memory is the DOS version found under dosstuff on your computer. good luck JERRY KA3BFY

5898. x1j Node ?

Topic: 5898 Message: 5898

Hi,
Does any one know if the X1J4 net node will pass APRS data in UI

We have 1 very remote site that is now basically off limits due to heavy mining. Getting permission to go there is very difficult to near impossible. They have down days when there is no person available to go there, you have to go through several different companies and involve about 10 different people to get there and be available at short notice.

I have looked at the docs and played with the alias to find that it will only allow WIDE1 not WIDE1-1 .

The ironic thing about this is that there are 2 of these digis we have Uidigi available but the restrictions out way
the effort required to get to them. if there is a possible fix that you know of please let me know.

They can be remote sysoped so changes can be made..

Thanks

Rick,

If your goal is to have a system on your bicycle that uses a transceiver, you have a few choices. There is the Argent Data systems OT2 (http://www.argentdata.com/support/tracker2.html) The Fox Delta unit (http://www.foxdelta.com/products/foxtrak.htm#fv2) and the Byonics TT4. (http://www.byonics.com/tinytrak4/)

This assumes that you require a unit that can send and receive, and will utilize your current radio and GPS (If you have the low-end Etrex, you won't be able to display other stations with any of these-only the more expensive Etrex's will do that)

Using a handi-talkie or mobile based tracker will not produce the optimally small APRS transceiver, but if you can handle the weight and bulk, I would suggest either the Opentracker or the Byonics TT4 (I don't really know much about the Fox Delta, other than the few things I purchased from them don't really work....)

Other options include finding a (discontinued) Kenwood TH-D7 portable, since it will support plug and play operation with an Avmap display GPS receiver, but clearly, this does not engage the equipment you already have. Its also a bit spendy, and the Kenwood radio was buggy and not, in my opinion, suitable for rugged field use. (Kenwood apparently agreed with me and dropped the radio from their line)

My best solution for a miniature, low weight APRS transceiver would be (modestly) The Byonics MT-TT4. (http://www.byonics.com/microtrak/mt-tt4.php) This is an APRS encoder/decoder, based on the Byonics TT4, but it has a built in half-Watt transceiver on 144.390. Your Etrex is probably compatible, and the unit is very small and light (about 3 X 3 inches, and weighs a few ounces without batteries.) There is a miniature 12 Watt amplifier (adjustable) as an option.

There are a couple of options in stand-alone trackers, the very cool Big Red Bee unit, the Micro-Trak AIO, and the Rtrak (I think they are all roughly the same price) or the less expensive transmit only units from Byonics, the MT-8000 FA, or the MT-300.

Welcome to the dizzying world of APRS!

If you look at the FoxView2 picture there, that daughter board with the
SDIP IC is a modified OpenTracker+. Didn't realize he was using it.
That's permitted by the license terms, but attribution would have been nice.

I have to (modestly) disagree and say the T2-301 is more capable, and
about the same price, but it's still in beta. But I'll save the
arguments for Dayton. =]

I was impressed with the Big Red Bee unit for transmit-only use.
Turning it on and off was a pain, as was programming it, but it was
small and worked well.

Scott,

Yes his designs are somewhat derivative....His first tracker was a carbon-copy TinyTrak 3. Imitation as they say, is the sincerest form of flattery. You would think though with the cost of Indian labor his end-user prices would be better!

I look very much forward to seeing your T2-301! The MT-TT4 has the singular advantage (for the time being at least) of actually being available. I surmise that you will be using the 5 Watt, 301 module from China, which is a pretty darn good little unit considering the price. But unless you have learned to bend the fabric of time and space, the module alone is heavier than an entire, assembled MT-TT4. This is mostly only a concern for the most portable applications, so I am sure it won't be a limitation on your products popularity. Its probably not a good or fair comparison to compare my tiny little single channel QRP transceiver with your frequency agile, high power unit. No need for a Dharma duel over this! (Although Byon and I will be happy to drink beer and compare notes with you in Dayton) Saber duels optional.

Will your new unit by any chance have USB support? I think your Garmin Fleet Vehicle interface work has been awesome, and I hope to see more Garmin units that can be fully supported.

I've shipped about a dozen beta units for the T2-301 so far, but volume production is still at least a few weeks away.

> China, which is a pretty darn good little unit considering the price.
> But unless you have learned to bend the fabric of time and space, the

Probably. It's about 6.5 ounces. Turns out you can get the power up considerably (9+ watts) if you keep the duty cycle low, so in that respect it should be compared to the version with the amplifier.

We're also working on FCC Part 90 certification for it. With luck, maybe that'll drive enough commercial sales that higher volume will mean lower prices on the amateur side.

I'm also working on getting the manufacturer to open up a bit with the radio firmware, but that's kind of a touchy subject. Worst case, I could probably start from scratch - I know how to program the PLL and most of the rest is pretty straight forward, but it'd take some work to do properly. Working with the Chinese is always an adventure... even without the language barrier, it's not like dealing with American or European companies.

True, and I can't take credit for the RF design. I'll leave the RF dueling to the SRB guys. I'll be happy to discuss trackers over beer at Dayton, though!

> Will your new unit by any chance have USB support? I think your Garmin
> Fleet Vehicle interface work has been awesome, and I hope to see more

Which new unit? =] I've got multiple things going right now. The Garmin FMI stuff isn't actually USB, even though it uses the USB port. The T2-301 does support FMI, and I've been driving around with one connected to my nuvi 350.

I'm playing around with a Coldfire system right now that'd certainly have USB support (and probably Ethernet as well), and I might do an intermediate 8-bit system with USB. I need to finish up some custom commercial projects first before I get back to those, though. In fact, I ought to be back in the shop working on one of those now.

5905. Re: Running APRS on 144.390 and 145.825 (ISS)

Yahoo group: APRS (2007 — 2010)
Date: 2009-02-21 02:40:00 UTC
From: Matt Freeman
Topic: 5891 Message: 5905

I should have included these details in the original post. Here's my
APRS setup:
VHF transceiver with TNC on a high gain ground plane does most of the work.
Scanner going through the computer's sound card and AGWPE is also in use
on a yagi.

I normally use the yagi for voice, but when I'm not talking, I use the
beam for APRS to help pull the weak stations.

Instead of keeping the scanner on the yagi at 144.390 MHz, I set the
scanner to the frequency used on the ISS, and switched the yagi for a
discone in the attic.

My thinking was that I could not send packets from the ISS and regular
APRS activity to the same server, so I assumed I would need two
programs/services/whatever. I was also concerned about stations from
the ISS interfering with the VHF propagation map
(http://www.mountainlake.k12.mn.us/ham/aprs/path.cgi?map=na). I don't
want unrealistic paths showing up all over the place.

So is what I'm doing alright?

Matt, WX4MET

Hi Fred

In my case I'm running traditional TNCs rather than sound cards. Although AGWPE is most commonly know as a sound card TNC utility, it can also be used to interface multiple traditional TNCs. ZL2TZE's post explains how to use a stereo sound card to emulate two TNCs.

5907. Re: [APRS] Re: Running APRS on 144.390 and 145.825 (ISS)

Yahoo group: APRS (2007 — 2010)
Date: 2009-02-21 04:17:32 UTC
From: Bruce Coates
Topic: 5891 Message: 5907

Hi Matt

I think you're on the right track.

A single instance of UI-view32, like most other APRS programs, is quite happy IGating traffic from multiple inputs. The trick is getting the multiple inputs connected to the APRS application, and that's where a program like AGWPE comes in. Here's what I have connected to my IGate, VE5BNC-3.

Port 1 - Paccomm Tiny2 on COM1 - TX/RX radio on 144.390
Port 2 - Kantronics KPC2 on COM2 - RX radio on 145.825 - J-pole antenna
Port 3 - Kantronics KPC2 on COM3 - RX radio on 145.825 - Eggbeater antenna
Port 4 - Sound card TNC on Left channel - connected to same radio as Port 2
Port 5 - Sound card TNC on Right channel - connected to same radio as Port 3

The three traditional TNCs an two sound card TNCs are all controlled by a single instance of AGWPE. A single instance of UI-View32 connects to AGWPE and IGates everything heard on any of the 5 ports. My IGate also gates messages from Internet to RF for local stations only.

I also happen to have some other instances of UI-View32 running but they're only used to generate map images. Those instances are not connected to the Internet and do not IGate anything so they're not really relevant to this discussion.

Why so complicated? Because one winter I was experimenting with AGWPE, multiple TNCs, sound card TNCs vs. traditional TNCs, different antennas, and multiple instances of UI-View32 all at the same time and I just never got around to disconnecting anything. It's really more complex than necessary, but it's one example of the way all the pieces can fit together.

As far as the propagation maps are concerned, I suspect that they exclude anything with any of the satellites in the digipeated path, so I don't think IGating ISS traffic will affect anything. One thing you want to watch out for are APRS programs that strip out the digipeated path when they IGate. AGWUIdigi is one IGate program that did this and that cause a few problems for me.

Did you get this to work? I'm tryin to wire a KPC3+ to a lowrance 7300 has two 232 ports. I anyone know how to set it up for bidirectional, it should be able to display stations on the GPS display.

I'm going to to the Mint 400 March 29th and hope to have the tracker/display setup in the race truck and my pit locations.

Topic: 5894 Message: 5909

I just wanted to take a moment and thank everyone for their input. I'm on the road this weekend (ahh, the life of a musician!!) so have had only a few free minutes to digest everything. We'll be back home Sunday evening, and I'll have a couple of days off to go through everything in detail...which looks like it might take me a bit! But I'm glad to see there are more options than I originally thought, and looks like I'm going to be able to be on the air before too awfully long!

From: wa5luy
Topic: 5910 Message: 5910

We are using a Kam KPC3PMX Ver. 9.0 for a digi. Our problem is we can't turn the digipeaters function off by remote access. After logging in, I get the remote prompt. I can change parameters OK. I have tried turning DIGI off and UIDIGI off but not at the same time.

Does anyone know the correct parameters to stop this version digipeaters from transmitting?

Wayne

5911. Re: [APRS] Remote turn off of Kam KPC3 digi question.

From: Chuck Kimball
Topic: 5910 Message: 5911

If you want to keep it from digipeating any UI Packets:
UIDIGI Off
UITRACE %
UIFLOOD %

DIGI on or off should only impact digipeating via the stations call
sign, alias and node names.
There is also the DIGI UIONLY option - see the manual.

If you want to kill the messages that it sends out, you'll also need to
disable the Beacons and Location Texts.

BEACON EVERY 0
BLT 1 EVERY 0
BLT 2 EVERY 0
BLT 3 EVERY 0
BLT 4 EVERY 0

Hope this helps.

Hey folks! I have two very basic questions.

1)Are there any guidelines for choosing your ID? I see callsign -5, -1. -9, etc, but I'm not sure how they're chosen.

2)What, exactly, is "smart beaconing" and how does it differ from a regular beacon?

I appreciate you putting up with newbie questions!

Thanks,
Rick N9GSU

Nothing is set in stone, but this is a good reference, atleast it lets
you easily tell what something is from first glance, expecually if you
don't have a map showing you the symbol.

http://www.aprs.net.au/aprs_ssid_guide.htm

>
> 2)What, exactly, is "smart beaconing" and how does it differ from a regular
> beacon?

smart beaconing is a method of transmission timing used to make your
driving route look correct on a map with as few as possible
tranmissions (when configured properly), it's not very useful if
combined with using voice-alert.

The thoughts to use smart beaconing or just timed depends on what
exactly you want to do with aprs. If you want it to look good on a
map, smart beaconing is going be best. If you want to just give a
general idea where you are, and use voice-alert, timed is going be
better.

My truck only supports timed beaconing, and I manually switch it from
2min to 15min when it's parked. On my motorcycle I use smartbeaconing
with paramitors to imitate timed 2 minute transmits, except when it's
parked, so I don't have to manually change it. I don't really care
what my route looks like on a map much.

Good Morning Rick

I hope these answers are correct. On call sign the -(number) indicates you are not at your home base. Smart beaconing takes into account Speed, turns, ect. instead of transmitting at specific times.

Sincerely, Jim Weiss WA7JEW

Yahoo group: APRS (2007 — 2010)
Date: 2009-02-25 13:57:17 UTC
From: Lynn W. Deffenbaugh (Mr)
Topic: 5912 Message: 5915

There are many version of this, but here's a few links to "standard"
SSID (the -number on your callsign) usage:

http://zlhams.wikidot.com/aprs-ssidguide
http://vk3.aprs.net.au/aprs_ssid_usage.htm
http://www.tapr.org/pipermail/nos-bbs/2006-December/001074.html

And for the SmartBeaconing, it is a tradeoff between bandwidth
consumption and resulting recorded path accuracy. You can read about it at:

http://www.hamhud.net/hh2/smartbeacon.html

The actual supported parameters in various implementations vary, but
basically you're telling it to beacon slowly at slow speeds and more
frequently at high speeds and to vary between the two speeds linearly in
between. In addition, you can tell it to beacon if your heading changes
by more than a configured amount (sometimes adjusted by the speed
"slope" at which you're traveling) but never more often than some
"reasonable" rate.

As with all rates in APRS, what is good for one person, or purpose, or
area is not good for another person, purpose, area. Ask around to your
LOCAL APRS community to find out what might be suitable and acceptable
for YOUR purposes.

Lynn (D) - KJ4ERJ - Google is your friend, but you have to KNOW what to
search for!

Ken,

How about the Byonics TT4? You can buy one as a kit or assembled and cased from 57.00 to 75.00 bucks, and you can order a plug and play cable for almost any radio.

IF the GPS has NMEA communication in and out, positions will be sent
to the Kenwood, and received waypoints, i.e. other APRS stations, will
be plotted on the GPS' display.

[Moderator here. Sorry for the delay. Yahoo tagged this as Spam for some reason]

As some of you know I am going to be making a road trip starting Thursday mid morning sometime. I am heading up the east coast. I will have my APRS tracking system running, it is an old TinyTrak 2 so messaging is not an option. For the hams with APRS you can find me under kb7tbt-9.

For those non hams or ham folks that don't have APRS I have my old faithful webpage still at:
http://www.kb7tbt.com/aprs/kb7tbt-9.htm
My webpage has all the weather maps, bread crum trails maps and all sorts of other goodies to play with.
The webpage will automagicly refresh itself so no need to keep clicking it.

I will be traveling from NE Georgia to NE New Jersey.
I will be on the 145.190 machine as long as I can hold it, the 6600 machine and has a gigantic footprint.
After I am out of its range I will just be on 146.52.

APRS is set to WIDE1-1, WIDE2-2 @ 3min

>increase the delay between lines when uploading?

Could you possibly reduce the transfer rate from whatever it is
(9600?) to e.g. 1200? Probably a dip switch on the TNC, and a setting
in Winpack. Or change the rate in the TNC with a command, and then
change it in Winpack. (don't know the Paccomm, but those settings are
in my experience either with DIP switches or with a command from a
terminal program)

I thought about reducing the baud rate. Slowing the upload down on a line by line basis, in addition to fixing the buffer problem, allows you to easily see errors in your program as the lines go by.

Thanks for the reply.

Topic: 5535 Message: 5928

Hi,

I searched on APRSPoint and came up with your message. I'm running a 710 with APRSPoint and while I can receive TCP packets, I cannot receive any packets when NOT in APRS mode.

I can run a terminal session against the 710 and I see the Kenwood boot message, but I see no packet activity, as I would if I set this up in APRS mode.

APRSPoint stipulates a Packet connection to the 710, and not APRS. Can you relate to me what you did? I know our kenwood models are slightly different, but not that much. I'm an experienced APRS user and have 2 710s and both act the same in this scenario.

Just for yucks, if I set the 710 into APRS mode, I can see a great deal of RF activity in APRSPoint, but nothing with packet. I am using 145.01.

I've just about pulled out all my hair :-). I believe this is a radio config issue. I am using 9600 N81 - the comm parameters are correct because I can see the Kenwood tnc message in the terminal session.

any thoughts or suggestions are appreciated.

Hi Randy
A TNC2 Ui-digi with UI-digi firmware would be best

You could run your TNC in KISS mode with Ui-View set up as a digi

This all depends on what you are doing eg : Remote site Digi or
a home site digi

UI-Digi is a good remote site with remote sysop available

Hi Randy,

I am a little unsure as to what "type" of node you are
talking about ?

If you wish to put an APRS Digi on then it wouldn`t really be called a
node as such but a level 2 digi peater which hasn`t much use other than
to pass APRS traffic.

However, if you are talking about a Netrom Node then that is a totally
different ball game and would allow others to use the "Netrom" and
"Routing" features to talk to other stations or a BBS etc.

APRS can still be used via a Netrom Node by using the Digi`s ALIAS call
in the path.

Anyhow, thats about it for what it`s worth.

Regards ..... Peter

5932. APRSPoint 4.5.1 available

Yahoo group: APRS (2007 — 2010)
Date: 2009-03-09 04:32:14 UTC
From: hxc98
Topic: 5932 Message: 5932

This version has better support for mappoint 2009 and added support for APRS symbols and overlays, and made several enhancements. Current users please pay special attention to #2, since your current settings may need to be changed,

1. Added support for standard APRS symbols and overlays,
2. Changed the way log files are saved, now you need to provide the name of a folder where logs will be saved, the name of the log file is genarated automatically by appending the date after 'log', so old logs won't be overwritten. You need to create the folder if it doesn't exist. Leave the folder name field empty if you don't want to save logs,
3. Better signal range calculation accuracy to reflect real world operating conditions,
4. Uninstall will no longer remove tnc settings file,

Thanks

5934. APRS Local Info Initiative AGWPE Utility

Yahoo group: APRS (2007 — 2010)
Date: 2009-03-09 09:43:26 UTC
From: wd5eae
Topic: 5934 Message: 5934

I've been interested in putting some of our local information (meetings, nets etc) on APRS for a some time now and I've seen a utility or two that will help do this but everything I've seen has been very limited. For example, one utility will transmit event info only as a bulletin. Many of the objects that can be put out over RF have a limited time and/or date range for which they are valid, some are recurring, some events need to be dynamically calculated and so forth. Everything I've seen either doesn't have any kind of scheduling in it or it requires detailed and frequent object maintenance. When to put an object on RF and when to take it off is something the computer can handle if the schedule file contains that information.

I've written a utility that connects to a local or remote instance of AGWPE, has an events data file with reasonably complex day of week (optional), start/end time (optional) and date range (optional)scheduling. I've written it so that the data can be changed on the fly by other programs, and the Scheduler knows when to reload the schedule. It also determines which items have modified schedules and which object messages were changed. In other words, for example, you could alter the xmission rate for an object or objects, save the file and the program would pick up the new rates without it losing the last transmission times for those objects. You can dynamically add or delete objects to the schedule file and the program retrieves those changes before the schedule checking routine reevaluates the object list for transmission.

I still need to build a GUI editor for the schedule file. I am using Notepad right now to create my test objects/events.

What I need are a few serious beta testers who will put some time into validating the scheduling routine and just do some general testing. Testers should either know or be able to figure out how to format object messages such as found on http://aprs.org/localinfo.html <http://aprs.org/localinfo.html>

I could make the schedule editing scriptable so that other programs could script schedule changes. I'd also be interested in seeing what other programs could be interfaced with (such as NOVA) to pull event data, such as an imminent satellite pass.

Once the basic functionality is tested/stable I'll release it along with the source code on my web site http://www.wd5eae.org <http://www.wd5eae.org>

If you are interested please email me at my callsign at arrl.net. Any suggestions would also be welcome.

73,

WD5EAE

I know that you had talked about using your own radio, but if you want a system that is fairly easy to implement, you might look at Argents' OT2 added to an Alinco DR-135 (inexpensive 2 meter rig) or Our Micro-Trak MT-TT4 (basically, a TT4 combined with a transceiver all in one tiny package)

Good luck, and let us know which way you go!

Subject: [APRS] What TNC to use for digipeater?

Hello everyone, I am just getting into APRS activity in NYC. I would
like to setup a digipeater in a repeater site to extend APRS coverage
in the NYC area. This site should provide excellent coverage to most of
Brooklyn, Queens, Manhattan, Long Island, and parts of NJ.

I would like to know what basic TNC I can use to setup as a digipeater.
My funds are limited and I already have the radio and antenna for the
site.
Information on how to setup the TNC would be greatly appreciated also.

I'm enjoying my VX8 and D710 very much for now.

Thanks
Ken

Topic: 5933 Message: 5939

Let's see if I can get it all down....

I use http://aprs.fi as my normal visualization software at home and on the road. You may ask how that keeps me informed of the "local" situation? I also run one of the IGates for the area and strive to make sure that ALL available RF traffic is gated through to -IS, so I'm pretty sure I'm seeing it all.

For the IGate, I have a TinyTrak4 on an Icom T22A HT speaking KISS into javAPRSsrvr (http://aprsisce.dnsalias.net:12501). The TT4 is KJ4ERJ-7 and the IGate is KJ4ERJ-2 logging on to the -IS backbone as KJ4ERJ-6 (I'm not sure why that last one is different, but I do it that way). javAPRSsrvr is also configured as a WIDE1-1 digi so that the local RF users have a chance to get heard by the WIDE2-2 digi (WX4MLB-3) north of me if they're needing that.

I track with a T2-135 embedded in an Alinco DR-135T and a Nuvi 350 as the GPS tracking as KJ4ERJ-9. Currently my T2-135 is rather deaf so the Nuvi doesn't display very much, but I'm hoping to get that fixed soon. If I hook the TT4 to the Alinco, it receives much better, but that's not my normal mode.

I also track directly into APRS-IS with my AT&T Tilt cellphone as KJ4ERJ-12. This is done with an APRS-IS client that I've written and have a few beta testers out there using. It also displays the local situation as seen by APRS-IS. It will eventually (hopefully soon) have map display capability as well as (further out) the ability to speak and listen to KISS for an RF interface. This will most likely be done via a Bluetooth to serial adapter onto a TT4 which is what my IGate does for isolation between the RF components and my javAPRSsrvr host.

Oh, and I sometimes run UI-View just for grins and also have a Linux virtual machine that can fire up Xastir on demand. And the TT4 IGate is replacing an AGWPEpro IGate (KJ4ERJ) whose laptop has become too unreliable to keep running.

I'm anxious to see what all others are running as well! Radios, TNCs, and software (along with callsigns) would make a nice complete picture if you're willing to share!

Lynn (D) - KJ4ERJ - Typically tracking as KJ4ERJ-12

Some radios seem to give the T2-135 trouble no matter how I tweak it.
I'm thinking there's extraneous power supply hum, GPS crosstalk,
high-frequency noise, or something else I'm not able to replicate here
that's messing it up.

I've got a batch of new T2-135 boards on the way, ver 1.2, and I'll be
putting some of those together as soon as they come in. If they work
like they're supposed to, I'll be happy to replace your older T2-135
with one of these (they add the same active filter as the OT2m) to see
if it makes a difference.

No upgrades, no. Add-ons are being made. I am using UI-View32 myself,
and I haven't seen any other Windows-based APRS software with better
functionality. If one comes up, I'll probably consider that one. But
UI-View32 is just as good as it was when the last version was
published mid-2004.

>Any hope for someone to take over UI-VIEW32 and attempt to maintain/update it
>or is it a slow sinking ship?

No hope, as the source code was destroyed according to the author's
(G4IDE SK) wish during his last days in life.
It isn't sinking. It will probably stay as a good APRS client until
it's passed in functionality by some newer software (look above). It
doesn't seem to have happened yet.

The best place for support for your UI-View software is the yahoo!
UI-View group.

I started off with WinAPRS but found it chock full of bugs, so I tried
UI-VIEW32 & found it to be much more stable. As I've mentioned here
previously, good software doesn't need updates & patches.

I've seen a lot of postings recommending XASTER, but that requires Linux &
I don't do Linux so I'll probably use UI-VIEW32 until the APRS protocol
changes in such a way as to break its functionality.

Hi,

Just wondering if there is a Nationwide 9600 baud frequency? If not, it's time for one. Lot of APRS traffic on 144.39 at 1200 baud. I listen to it here and there is very little silence. Imagine the data/info we could put through at 9k6. Less dependent on the internet to carry our APRS traffic. Just a thought. I'm in comments and possibily leading to a Nationwide discussion.

Great input, great deal.
Here in FL we're using some 9k6 traffic on 70 cm.

All the best, 73 de Udo (KF4KUL)

Hi,

Just wondering if there is a Nationwide 9600 baud frequency? If not, it's time for one. Lot of APRS traffic on 144.39 at 1200 baud. I listen to it here and there is very little silence. Imagine the data/info we could put through at 9k6. Less dependent on the internet to carry our APRS traffic. Just a thought. I'm in comments and possibily leading to a Nationwide discussion.

There isn't one. At least not for our nation.

I would love to switch to all 9600baud, but there are always issues :)

9600baud requires about 3db more signal strength to decode than 1200baud

9600baud equipment is much more expensive

It is really unlikely that 9600baud will save much *on air* time,
except when digipeaters spit out a batch of held packets

I'm not saying it wont save any time at all, but it isn't going bring
but maybe double the capacity to the network.

I will assume we transmit a 100 byte packet (normal mobile station approx)

On 1200baud that would take 0.66seconds to transmit

On 9600baud it would take 0.08seconds

If we assume people used a normal radio to transmit this, probably
need to add 200ms of keyup time, so 1200baud = 0.86seconds, and
9600baud = 0.28seconds

And the part I don't know, is how long of dead space you need before a
station considers the channel clear to transmit.

5949. D700 with Nuvi 350- waypoints not disappearing

Yahoo group: APRS (2007 — 2010)
Date: 2009-03-15 22:40:15 UTC
From: Stephen Prior
Topic: 5949 Message: 5949

Perhaps I'm missing something here, but I'm using Scott Miller's proprietary cable to link my D700 with a Garmin Nuvi 350 and it's all working as it should apart from one thing.

I have found that waypoints which appeared on the Nuvi 350 from a mobile station are still there three days later. It's the only mobile I have seen on my screen (he was parked up) in that time, so I can't be sure that if he had moved whilst my APRS system was on that I would not be getting multiple waypoints shown as has been reported to be the case when using other Nuvi models. If Scott's reading this then I hope he understands what I mean. What I cannot find how to do is to clear my Nuvi screen of this and other old objects.

This is a limitation of gps's, there is no waypoint delete command, so
you have to go into the gps menu, and delete all points manually
youself how ever often is good for you. I normally do it every
2-3days, or before a longer trip.

I haven't used the 350 myself so I am not sure of the exact button
presses to do to ease them.

The GPSes have no expire time for waypoints. You should expect,
though, that the next time one particular station's packet is received
by your radio with a new position and hence input to the GPS, the
waypoint will be displayed at its new position. I write "waypoint"
deliberately, because the points of the moving or fixed APRS stations
are treated just as an ordinary waypoint by your GPS.
I would think it as a bad idea if the GPS would delete my waypoints on
a planned sailing route while I was heading against it, just because
it were e.g. 12 hours "old".

Hi Jan

Well, since posting the message I have thought a little more about it and what you say, is of course correct! What I need to do now is how to clear the □waypoints¹ on the Nuvi. I guess I shall have to read the manual!

5953. Insert A Posiiton Report?

Yahoo group: APRS (2007 — 2010)

From: Richard Bauer
Topic: 5953 Message: 5953

i've got an APRS tracker in our camper so that friends and family can track us while we're on a trip. in many cases where we're camped or stopped for the night do not seem to be within range of an APRS station as our position is rarely updated. for instance, tonight we're overnighting outside of tulsa, ok but our position is still being reported as our home back in illinois. we were in eureka, mo last night which is about 30-miles west of st. louis but our position was not picked up.

is there a way to manually insert a position report via the internet?

thanks,

I dunno about a website that will let you do this, but

Installing any aprs program onto your computer, and using it to
connect to any aprs-is server will do it easily, and if you can
connect a gps to the computer, you won't even have to bother to enter
that stuff manually.

Stephen,
I'll try to walk you through what you are trying to accomplish.
From the map screen, press "menu". Then follow by pressing "where to?", "my locations", "favorites". Here will see a list of all the units (waypoints) received via APRS and plotted on the nuvi 350. You can touch an individual unit which then will allow you to do a couple of things. You can see the unit's last reported position by touching "show on map" or you can delete the unit's location by touching "delete".
If you wanted to delete all of the last positions stored in the GPS, touch "delete all" after touching "my locations". This will delete everything stored as a waypoint including any set by yourself, such as your home location.
If you are interested in following the movements of a particular station, the map will update each time a new position report is received. As long as you are zoomed out enough you can keep an eye on the station.
Hope this helps you out. If you have any other questions, I can try to help you out. Please email me off the group as I check individual emails more frequently than the group messages.

We fulltime in a fifth wheel and use our tracker for similar reasons to what you wrote. We too find ourselves in places where there are no digis. here is what we do

If we have internet I use UIview to manually enter a position report. If we do not have internet then I use the winlink network and the position reporting part of Airmail to send a position report.

Between the three methods we usually get our position report out on a regular basis. Our family knows that if the report is a few days old we have not moved. If we are on the move we update at least by the end of the day when we are set up for the nite - as long as we can get an HF antenna up.

You can track us at:

Your tracker is not working properly.
You should have gotten into the APRS-IS while in the STL area, and certainly in other areas along your route.

In the meantime, any APRS client can connect to one of the APRS-IS servers with a validated connection and send position reports. For a Windows machine, I like UI-View the best.

5960. need help finding info on setting up a digipeater

Yahoo group: APRS (2007 — 2010)
Date: 2009-03-21 03:05:23 UTC
From: cpmanntx
Topic: 5960 Message: 5960

hello all,

I am considering setting up a digipeater to serve the west side of Houston and am in need of some information to set this up. I want to purchase a new 2m radio and need to know what other hardware I would need to "repeat" the traffic in my area at a high enough power to overcome the noise in our area and reach a i-gate. Again, I am a novice and would appreciate any direction to information that I can utilize to educate myself. Thanks in advance for your support.

Chris,

A quick check at aprs.fi shows a couple stations that are igating on the west side of Houston. K5WH-2 and KC5EVE-12. Someone more knowledgeable that myself could advise on the best equipment for digipeating, but if that area is fairly flat(I'm not sure of Houston's geography?) neither should be too hard to reach.

Another thing you might want to consider is setting up your own Igate. That should also improve coverage for everyone to the west of Houston. It takes less to do that than to digipeat providing you have a good, dedicated internet connection.

Another plus to setting up your own Igate would be to help reduce the amount of relays and hence the RF in the area, if by noisy you meant heavy radio traffic.

Good luck and welcome to APRS,

Charlie

If you want to set up an Igate the requirements can be pretty simple.
You can do it with a little as a reciever(scanner), a computer and an
interface cable.

Set up a scanner or radio to listen to 144.390. Then connect that to a
computer with a store-bought or homebrew interface cable. Use a
soundcard modem program to receive the audio from the radio/scanner. And
another program to gate that to an APRS-IS server. Of course, the better
your antenna setup is the better you'll hear.

At least that's a simple way to get started. From there you can get as
fancy(expensive) as you want.

What I've been using is an old KDK 2mtr mobile rig I picked up for $20
bucks, a couple homebrew cables, and an old computer that was given to
me. I probably don't have much over $50 invested. I use Linux with
Soundmodem and Xastir but there are some good Windows programs as well.

I am going to start by asking a question: How much are you wanting to spend on this project? You can buy a KPC3 and have all the bells and whistles or you can go simple and save yourself some money with a decent TNC that dosent cost an arm and a leg.
Ot2m and tiny trak4 are good ways to get started with a decent digi and the antenna height is another.
Drop me a line and let me know what you want to get started with.
Thanks
Peter Summerhawk-N0WRE

ok,
after some investigating I have decided that setting up an Igate would best serve the needs of our area. I have downloaded ui-view and agwpe and have a scanner that I can dedicate. I am going tonight to either get a cable or make one.....I need help getting the software set up to run. I have looked over the help files in both software, but they seem to not be clear on setting up the uiview to use th agwpe...can anyone direct me to a good website to get this info or provide assistance?

thanks and 73's

Chris,

A quick check at aprs.fi shows a couple stations that are igating on the
west side of Houston. K5WH-2 and KC5EVE-12. Someone more knowledgeable
that myself could advise on the best equipment for digipeating, but if
that area is fairly flat(I'm not sure of Houston's geography?) neither
should be too hard to reach.

Another thing you might want to consider is setting up your own Igate.
That should also improve coverage for everyone to the west of Houston.
It takes less to do that than to digipeat providing you have a good,
dedicated internet connection.

Another plus to setting up your own Igate would be to help reduce the
amount of relays and hence the RF in the area, if by noisy you meant
heavy radio traffic.

Good luck and welcome to APRS,

Charlie

Update....

I was able to purchase a cable @ Radio Shack....

i have ui-view 32 agwpe installed and it seems to be configured properly, but I sam still not seeing anything of any consequence on APRS.FI.

I can hear the sounds made by my aprs rig through my sound card, I can see the data stream at the bottom of the ui-view screen. I just don't know how to make sure what is being send through the sound card is being picked up and pushed to the internet. I am not sure that I am using the right com port on the agwpe setup to get the sound card to the internet. Any help or suggestions appreciated....

Hi......

I may have the opportunity to put an antenna on a new tower going up. We have very sparse APRS network coverage up here in NW Wisconsin (Burnett County).

The tower would be near a heated (minimum 50F, not cooled in the summer) building with power and internet access.

What are the Good, Better, & Best complete configurations for equipment to set up an APRS digipeater and IGATE. I would be able to check on the equipment a few times per week.

Many thanx.................. jt

y you plan to use the software for your XTMR, then UI-view 32 works good
in Windows. If all you want is to track your vehicles or others, just
go to APRS.FI there enter the call sign you want to track or set it to a city.

A lot of people like ui-view.

my friend likes to use aprspoint for its filtering abilities, I like
it cause I can use mappoint for better detail tracking.

agw tracker seems very nice, but I have only used it alittle bit so far

newbie question..

I am looking for a software package that can take both APRS data and user annotated locations and display them on a map.

Not all my event will have APRS but would like to annotate on the map where various resources are located as well as have APRS map stations in the area. Will need something that can give me a view from a county down to a street view.

Have tinkered a little with APRS but just as a casual user.

Many of the APRS programs can do what you describe. You didn't
mention which operating system you wished this for.

There are versions for DOS, Mac OS9, Mac OSX, Windows, Linux, other
Unixes.

Everybody has their favorites. See the "Software" section at
<http://info.aprs.net>

All aprs clients can place objects.
You might want to use UI-View32 with Precision Mapping and an UI-View
addon called PMap server.
Go to <http://www.ui-view.org> for info (and/or join the UI-View
yahoo! group)

I don't know because I haven't been studying that Garmin. But you must
have a GPS which has a NMEA port; the USB port in a GPS cannot be used
(there is a possibility with a particular cable for some of the n?vis)

UI-View32 is widely used and there is a large yahoo support group for
it. You don't buy it (nor do you buy a license to use it), but the
author G4IDE (SK) wanted users to donate to cancer research in her or
his home country.
Look at <http://www.ui-view.org>

Our SCAT(Sheriff Communication Auxillary Team)will be replacing a Yaesu dual bander, which is dead, with a new 710 Kenwood. After installing it in our converted motorhome which is now the MICC(Mobel Incident Command Vehicle), we will attach a GPS unit to it with a cable going to our computer for observation of other GPS units used in Search and Rescue, etc. We have also purchased four new self contained Bionic units that also have a 10 Watt VHF Amateur transmitter encased with the GPS unit. The County Sheriff presently uses Ozi Explorer software and its own maps. These Bionic units will help us in the MICC to know at all times where our people are. Since we live in the mountains,some of us also have digipeters in our position to help relay messages, etc. If anyone has a better system, let me know.

APRS objects would be viewable by anybody monitoring the local APRS traffic which is handy if multiple locations need to keep track of the objects.

If the objects just need to be seen on one computer, UI-View's overlays are real slick. I've used them on bicycle events where I've wanted to see the locations of the SAG vehicles (including me) in relation to the checkpoints along the route.

It looks like you have done a great job. I do have one suggestion,
I own a TH-D7 Kenwood HT I used with a GPS for APRS. A couple
of days ago, I purchased the new YAESU VX-8 HT with APRS built
in. It also has a host of new features that would be very helpful
for SAR, or Disaster, needs. I have only had this unit for a
couple of days, and still have not learned all the cool things
it can do. I still have two TMD710As with two G5s GPS, and
we love them, but I think YAESU has taken the lead with APRS
HT units. My XYL Vicki (K5VLK) is so excited about it, she wants
me to get her one ASAP. By the way, the YAESU is about 1/2 the
size and weight of the Kenwood HT, plus the GPS in built in, very cool.

Several of my friends involved with disaster communications, have
ordered the new YAESU VX-8.

Hope this helps,

73,
de

Some clarifications just in case the wording is ambiguous:

> Our SCAT(... Team) will be [installing] a new D710
> Kenwood... we will attach a GPS unit to it with a
> cable going to our computer for observation of other
> GPS units used in Search and Rescue,

Yes, assuming the GPS you use has map displays. And even better,
if you use the AVMAP G5 GPS, then the map display will have the
actual APRS symbol. It is the only GPS with the full 200 or so
APRS symbols.

> Since we live in the mountains,some of us also
> have digipeters in our position to help relay messages, etc.
> If anyone has a better system, let me know.

Question will be whether to stay on the 144.39 national channel,
or during special events, set up your own frequency. Or to stay
on 144.39 and use alternate inputs of 144.99 in the field for
the trackers and an on-site digipeater. This eliminates any QRM
to the trackers... But they can only be tracekd in the range of
your temporary 144.99 input digis.

[Moderator here. This message was flagged as Spam by Yahoo. I don't know why. Sorry for the delay.]

i want to thank you, patrick, as well as kevin, nb7o and jim, for answering my post. we're currently camped neaar benson, az and have e-mail access. i apologize foe the delay in responding back.

i have UIView32 installed on my laptop although i've never used it in a mobile environment. the radio is an alinco DR-135 MkIII with an on-board T2-135 tracker. the radio and tracker are working but as i mentioned in the original post i'm not always within range of a digi. here in benson the radio is hearing APRS traffic but i seem to be just out of range to be heard by those stations. the radio indicates it is transmitting and that is most certainly working since our position IS being plotted from time to time.

i had installed UIView on my Dell laptop (D810) many moons ago with a thought towards using it one day but just never got around to it. all i really was interested in doing with mobile APRS was providing a means of tracking so friends and family can 'see us'. i fired up UIView earlier today, navigated the map to benson, az, connected an audio cord between the radio's audio out jack and the laptop's mic input jack but nothing is displaying on the UIView map. the DR-135 manual section on APRS doesn't mention needing an audio cable between the radio and PC's mic port so i removed it but i'm still not seeing anything on the UIView map but i am seeing traffic in the UIView terminal window.

soooo...i've been playing around with the UIVIew setup menus but i'm not having much luck displaying any traffic. i sure could use a bit of tutoring to get this combo up and running. these are the current settings in UIView:

COMMS SETUP
4800 baud, no parity, 8 data bits, 1 stop bit, COM port 1, handshaking is none, host mode is none, TNC is set to DR-135TP

STATION SETUP
callsign is N9DKO-13, lat and long are left blank, Unproto Port is 1, Unproto address is WIDE1-1,WIDE2-2, UIView tag box is checked, beacon interval is set to 15 (fixed), 1.0 miles (mobile), internet is set to 15,

GPS SETUP
COM PORT is 1 with an * and the Show GPS cross-hairs box is checked.

APRS COMPATIBILITY
Unproto address is set to APRS (isn't that contradictory to the unproto address in the station setup??).

when i startup i'm getting a bunch of invalid command errors in the terminal window:

cmd:MON OFF
MON OFF
MONITOR OFF

cmd:ECHO OFF
ECHO OFF

I've got something coming out soon that I think might be of interest to you. It's in a package the same size as the Byonics all-in-one, but it's a transceiver (rated at 5 watts, can be pushed up to 9 or 10) with full digi capability and the ability to output waypoints to a mapping GPS receiver. (They also include an internal SiRFStar III receiver.)

So instead of only the CP being able to track all of the field teams, they can see each other, as well as any objects created by the CP - search assignments, PLS/LKP, rendezvous points, and so on. I'm also working on a way to give search teams a few buttons they can push to create map objects themselves, to mark tracks/sign, flag remains for a bone ID team, or whatever.

The first four units are due to ship next week. Full scale production is going to take a little while. There are some pictures of one prototype in various stages of development here:

http://n1vg.net/images/sar_tracker.jpg
http://n1vg.net/sar_antenna.jpg
http://n1vg.net/sar_tracker_inside.jpg

That rocker switch might not be what's in the final version. It's a really tight fit, and almost as expensive as expensive as the whole case.

Also, FCC Part 90 certified radios are on the way, so you'll be able to use this on commercial frequencies (136-174 MHz) as well.

Once I have the hardware done, I'm going to be working on some SAR-specific mesh routing features that should be more efficient than standard APRS digipeating. Until then, it's got all of the standard Tracker2 features with the exception of an internal temperature sensor.

Exactly what APRS was designed to do.

> Not all my event will have APRS but would like to annotate on
> the map where various resources are located as well as have
> APRS map stations in the area. Will need something that can
> give me a view from a county down to a street view.

Any object that anyone puts on any APRS map should show up on
everyone else's map.

Just be sure to use a client software that efficiently
distributes these objects on the air. The concept is that a new
or moved object gets transmitted immediately and is refresed
rapidly initially, but the refresh rate decays as time passes,
so that new data is rapidly and reliably propogated, but old
data that has not moved, is updated less and less often so that
channel loading always gives new, fresh information higher
priority.

Some clients ignored this fundamental APRS principle and can
really bring the network to its knees when lots of objects are
being used. These fixe rates give ALL objects equal channel
time, leading to either too-high a rate for all objects and
maximum QRM, or too low a rate to give any meaningful latency to
real-time operation...

5997. APRS "Remote Viewing"

Yahoo group: APRS (2007 — 2010)
Date: 2009-04-04 12:58:42 UTC
From: Edgar Sack
Topic: 5997 Message: 5997

This setup may have been reported before but I have not seen it recently.

I like to monitor the many active APRS stations in my area on an old laptop that is not located anywhere near the ham shack.

I also like to use a receiver to monitor the 144.390 mh signals that is located a distance away from the antenna on which I am routinely transmitting my APRS WX information to avoid any chance for "front end overload."

The APRS data stream can be successfully transported wirelessly using one of the several low power broadcast FM band transmitters available on the market. I have tried this for APRS signals with both a unit built with a Velleman kit and with the commercially assembled unit available from C. Crane and Company and have had success with both units.

Any reasonably sensitive portable AM/FM radio with an audio output jack will serve as a receiver. Of course, it is preferable to use one that has a "mains" power supply since you are likely to want the setup to be powered "24/7."

Just hook the 2 meter receiver audio output into the FM transmitter audio input and check that the audio level is set properly by listening to the signal on the receiver. Set the transmitter to a broadcast FM frequency that is not occupied by a strong commercial station in your area. Then hook the output of the "remote" receiver to the audio card input jack of the laptop and again be sure that audio levels are set correctly by watching the sound card audio drive bars on the PC screen.

The remote receiver can be 45 to 60 feet from the transmitter depending upon how many RF barriers there are between them. In my case, the transmitter and receiver are located "three rooms apart" and the walls in the building are of steel stud construction.

Adding to these ideas, has anyone found a way of sending data from the
Aprs computer through the router to allow anyone to connect to that IP
address and receive the data stream via the packet engine?
I have the network working internally (LAN), but would like to take
the lap top somewhere and connect to the Internet through an open port
and view the data coming in at the Aprs station.

By "packet engine", do you mean AGWPE?

If so, then yes, it can be done. I've hooked Xastir in WA to an
AGWPE instance in NY for testing before. Works great although then
it looks like I'm local on RF in NY when I'm not.

Please describe a bit about your current setup plus exactly what you wish to do, otherwise it's difficult guessing at what might fit.

If you have an APRS client hooked to a TNC and/or an internet feed, it's possible that client also has server ports available that you can then hook another client to. Xastir has this, so you can hook multiple Xastir instances (or other clients) to the one instance that has the TNC's.

If you have AGWPE hooked to your TNC (necessitating a Windows box there), it has facilities for setting up a login/password for clients to connect to it remotely. That's how I hooked Xastir to an AGWPE instance in NY.

There are also methods to have TNC's on a remote machine but the client on your local machine (other than AGWPE).

Ok, thanks for your advice. I have a digi and weather station using
UiVIEW ,connected to the packet engine. I mentioned to a computer guy
that I would like to view maps on other computers in the building. He
configured the system to allow me to use AGW tracker on a lap top, on
the LAN. After being able to receive the data on the laptop
internally, I thought it would be possible to see the same data
remotely. All computers use the Windows operating system.
I just want to be able to view the data that is being received at the
digi, from any Internet connection using UiView or AGW tracker etc.

The County Sheriff presently uses Ozi Explorer software and its own maps.

Clark does the sheriff have APRS on his OziEx maps.

OziEx is my main mapping program, but not for APRS. I know that the development version has AIS (Automatic Ship Identification), so has someone been able to use OziEx with off-air APRS.

This is what I do, but the program I use is Ultra VNC, a remote desktop ap, and its free.

I have my digi atop a high building, and was able to convince the IT folks to donate a broadband connection, so not only can I remotely connect, it lets the digi be an iGate too.

I've got one of those "large book" sized Dell CPU (no monitor/keyboard/mouse) inside the radio cabinet, and have UI-View and PM8 installed on it.

I can now easily connect from any computer (by loading the small peer ap), and its like you are right in front of it.

And if you have a phone line, and a modem on the controlling CPU, I can tell you how to set up a clever remote session that way too.

You can see my digi set up here; http://www.n8wct.com/n8wct-4/

Subject: [APRS] APRS "Remote Viewing"

This setup may have been reported before but I have not seen it recently.

I like to monitor the many active APRS stations in my area on an old laptop that is not located anywhere near the ham shack.

I also like to use a receiver to monitor the 144.390 mh signals that is located a distance away from the antenna on which I am routinely transmitting my APRS WX information to avoid any chance for "front end overload."

The APRS data stream can be successfully transported wirelessly using one of the several low power broadcast FM band transmitters available on the market. I have tried this for APRS signals with both a unit built with a Velleman kit and with the commercially assembled unit available from C. Crane and Company and have had success with both units.

Any reasonably sensitive portable AM/FM radio with an audio output jack will serve as a receiver. Of course, it is preferable to use one that has a "mains" power supply since you are likely to want the setup to be powered "24/7."

Just hook the 2 meter receiver audio output into the FM transmitter audio input and check that the audio level is set properly by listening to the signal on the receiver. Set the transmitter to a broadcast FM frequency that is not occupied by a strong commercial station in your area. Then hook the output of the "remote" receiver to the audio card input jack of the laptop and again be sure that audio levels are set correctly by watching the sound card audio drive bars on the PC screen.

The remote receiver can be 45 to 60 feet from the transmitter depending upon how many RF barriers there are between them. In my case, the transmitter and receiver are located "three rooms apart" and the walls in the building are of steel stud construction.

The RC-D710 (the faceplate of the TM-D710) does NOT control the TM-D700. You can't replace the D700 faceplate with the D710 plate and expect to have basic control over the radio. The RC-D710 will act as a standalone TNC with any radio but for the transceiver controls (VFO, Memory, etc) it will only work with the D710 body.

6014. New Digipeater in Brooklyn NY

Topic: 6014 Message: 6014

Hello everyone, I just recently finished installing a new digipeater up at a very high central location in Brooklyn NY. The digipeater callsign is K2MAK. It consists of a GE MVP VHF mobile, KPC-3 ver 9.0 firmware, 50-ft of hardline, and a Comet GP-3. The height of the antenna is @450ft above ground. The transmitter output is approx. 20 watts.
Please let me know how well it works for you.

Next digi will go up at Midtown Manhattan.

Ken

Ken,

This is great news and everyone in the area will really appreciate it. It is great when individuals take on these service projects!

I hope you don't mind if I comment on some things I see in the settings? Can I ask where you got the info on setting it up? I can see that it is using many obsolete settings that are not generally part of the New-N paradigm since 2004 that helped bring about a 3 to 5 fold improvement in network efficinecy and reduced QRM...

Maybe you could take a look at and consider the recommended settings on
www.aprs.org/fix14439.html

Items I can see from your beacon are:

* it uses a T overlay which is only for Paccom obsolete TRACE digis 4040.04NT07357.41W#

* It does not announce the recomended "W2, NYn-N..." user recommendations for people in the area

* It announces WIDE/RELAY which is obsolete and bad for the network

Things I cannot see directly for sure, but can infer might be:

* it is not transmitting the local voice frequency object for travelers in that area (I dont see one within 15 miles anyway)
see www.aprs.org/localinfo.html

* it propbably is not using the proportional pathing for its beacons (uses the 4 LT's, LTP's and BLT's). Without proportional pathing, the beacon rate is probably too high and causing QRM over too wide an area, and at the same time not providing better information latency in its own area.

Anyway, you are using a KPC3 9.0 ROM which is the latest... but actually, the earliest 9.0's were recalled due to a digipeater bug and replaced at modest expense to a fixed version. It might be worthwhile checking ther version number. the web page above will help.

Further, from your central location, you can help look around at the other surrounding digis and see if they are properly set up to the New-N paradigm too. Then contact those operators if needed and see if you can get them to consider these new more efficient settings too.

Thanks
Bob, WB4APR
the digipeater troll

I have uploaded a photo of the first production version of the Micro-Trak BFT. Its a single channel transmitter on 144.390 only that has about 35 Watts output at 12 volts and up to about 45 or so Watts at 16 volts input.(adjustable, naturally) It measures 4.7 X 2.4 inches and weighs around 3 ounces. I hope to have the first of these in Byonics' hands next week, and I expect a target price of around $200.00 bucks.

2009 TAPR/AMSAT Banquet at Dayton Hamvention

The third annual joint TAPR/AMSAT Banquet will be held Friday evening, May 15, 2008 during the Dayton Hamvention.

The Banquet will be in the Jefferson Room at the Kohler Presidential Banquet Center, Kettering, OH (just south of Dayton).

Reservations are required and must be made by Monday, 11 May 2009. Seating is limited, so make your reservations early.

TICKETS WILL *NOT* BE AVAILABLE AT HAMVENTION; YOU *MUST* REGISTER IN ADVANCE!

The price for the Banquet is $30 per person. Reserved tickets may be picked up at the AMSAT booth at Hamvention on Friday, or at the door.

You may make reservations for the 2009 TAPR/AMSAT Banquet online in the AMSAT Store or contact Martha at the AMSAT office. You can reach Martha from 10:00 AM to 6:00 PM EST/EDT at (301) 589-6062, or in the US toll free at (888) 322-6728.

For additional information contact Martha at the AMSAT office (martha@...).

6:30 PM Doors open and Cash bar is available with Beer, Wine, Liquor and soft drinks.

7:15 PM Buffet Dinner service begins. The Center has a justly deserved reputation for good food and service.

Subject: [APRS] Micro-Trak BFT high power APRS transmitter

I have uploaded a photo of the first production version of the Micro-Trak BFT. Its a single channel transmitter on 144.390 only that has about 35 Watts output at 12 volts and up to about 45 or so Watts at 16 volts input.(adjustable, naturally) It measures 4.7 X 2.4 inches and weighs around 3 ounces. I hope to have the first of these in Byonics' hands next week, and I expect a target price of around $200.00 bucks.

6025. anyone know

Yahoo group: APRS (2007 — 2010)
Date: 2009-04-19 12:29:54 UTC
From: ccrtf38
Topic: 6025 Message: 6025

Does anyone know if a Magellan Maestro 4350 would work for APRS? And is there any cables and software that it would work on. I have a TH-D7A portable and woulds like to set it up in my vehicle. Then eventually add a laptop computer to other list of radios and other items in my 2007 Toyota Double Cab Short Bed Tacoma.

Dennis,

Your GPS only has a USB interface and is not going to be compatible with pretty much anything in the APRS world. Sorry.

Is it not possible to write software to use the USB port, as most of the new GPS's have USB only, or is it more complicated than that, just wondering.

USB is much more complicated than just "writing some software". The
hardware interface seems simple enough (4 or 5 wires out a standardized
port), but all USB GPS devices are USB slaves that require a USB
master. There's a whole bunch of networking-type protocols that fire
around the bus to get everything set up when the device is first plugged
in. And on top of that, some of the newer, cheaper USB GPSs actually
put a bunch of the actual GPS processing on the host machine in the USB
drivers rather than put the necessary processing power in the GPS unit
itself. Cheaper to manufacture and easier to update.

Lynn (D) - KJ4ERJ - A programmer, but NOT a USB expert!

Dennis,

Its certainly possible to write software to support a USB device, but the problem is much more complicated than that. The primary problem is that USB devices can be either a host or a peripheral, and essentially, you are asking the GPS to change jobs. One manufacturer created a widget to allow the use of a Garmin NUVI 350 with a Kenwood 710 radio, whereupon Garmin canceled the production of that particular display GPS receiver. The best supported display GPS receiver out there is the Avmap G5, which will work perfectly with the Kenwood radios (and our Micro-Trak and TinyTrak TT4 devices) It has an enormous screen, it will display the actual APRS symbols, and it works with either Kenwood or NMEA format devices. Clearly it is not the intent of the other display GPS manufacturers to support APRS operations, and they have tied our hands when it comes to supporting them.

So get a D700 to Nuvi cable from Argent Data Systems and a Garmin Nuvi on closeout. The Nuvi 350 has been seen in the $100 to $150 range recently, if you can still get them. There are plenty of other Nuvi's still being made, but check which one(s) work best with Scott's intelligent cable.

I'm running the Nuvi 350 with the D710 with the cable from Argent and it works great.. Plug and play... The only problem I see is the Nuvi screen is smaller.. But then again your not suppose to be looking at the screen while your driving..hihi..

I have been interested in APRS for some time. I think I would like to at least set up a station in my shack where I can pick up APRS packets off the air and map them. What software and hardware do I need? I have an old Heathkit HD-4040 TNC. Can I use that or will I need to buy a new TNC? I plan on making a cable to connect to my radio. Any help would be greatly appreciated.

That should work fine for a TNC Kevin.

Personally, I like UIView for a client. It's somewhat of a pain to get set up intially, but works great once it's running. I believe there is a UIView group on Yahoo that will be helpful.

73 es good luck,

Start here:

http://info.aprs.net

Specifically check out the "Software" page. After you've digested
what's there you might head off to nwaprs.info or else Bob
Bruninga's pages and study up on things there.

You didn't tell us what operating system you want to run the APRS
software on.

Is the HD-4040 capable of KISS mode? Is it a TAPR-2 clone?

Keep It Simple Stupid. Really! That's what it stands for.

It's a mode you can put many TNC's in where they receive a packet
and check the checksum. If it's ok, they dump the packet in it's
original over-the-air representation of bits up to the computer, and
the computer does all of the protocol work. When the computer wants
to transmit, it creates all the bits it wants to see go over the
air, and dumps it down to the TNC in a KISS packet. KISS packets
are very simple, with just a flag on each side of the packet and
some escape sequences for the flags and for some KISS control
packets that can be sent down to the TNC to set transmit delays and
such.

Many APRS programs will work directly with a KISS-protocol TNC and
that mode usually works better than trying to talk to a TNC from a
program in command-mode.

If you try Linux, try Xastir for APRS: http://www.xastir.org

For Winders, UI-View is generally considered the easiest to get
started with. It really leads you by the nose through the setups.

This was an interesting presentation but incorrect on one point, the Pocket Tracker was developed by Tony Barrett of Hi-Value Radio, in conjunction with Byonics. This is the original "Altoid box" tracker, out of production now for many years, of which he spoke. Scott Miller, of Argent Data systems makes the very fine OpenTracker products.

Byonics has them in stock right now. They should be up on the Byonics page (www.byonics.com) or they will be shortly.

This was an interesting presentation but incorrect on one point, the Pocket Tracker was developed by Tony Barrett of Hi-Value Radio, in conjunction with Byonics. This is the original "Altoid box" tracker, out of production now for many years, of which he spoke. Scott Miller, of Argent Data systems makes the very fine OpenTracker products.

6044. FORUM SCHEDULE ANNOUNCED FOR 2009 DAYTON HAMVENTION

Yahoo group: APRS (2007 — 2010)
Date: 2009-04-21 01:25:39 UTC
From: Mark Thompson
Topic: 6044 Message: 6044

==> FORUM SCHEDULE ANNOUNCED FOR 2009 DAYTON HAMVENTION

One of the many highlights at Dayton Hamvention is the myriad of educational and fun forums that take place the entire weekend at Hara Arena. The Dayton Amateur Radio Association has coordinated 45 unique programs that encompass nearly 80 hours of programs and activities for the thousands of people expected to attend these programs. Hamvention, the largest event of its kind, will be May 15-17 at Hara Arena in Dayton, Ohio. Please keep in mind that the schedule may change before Hamvention.

Friday, May 15
9:15-11:15 -- TAPR Digital Forum (Room 1)
9:15-10:15 -- Engineering Manuals (Room 2)
9:15-10:15 -- Kit Building (Room 3)
9:15-10:15 -- QRP (Room 5)
10:30-12 -- Drake Forum (Room 2)
10:30-12 - Teachers Workshop (Room 3)
10:30-11:30 -- ARRL Field Day (Room 5)
11:30-12:30 -- APRS Forum (Room 1)
11:45-12:45 -- QSL Cards (Room 5)
12:15-1:15 -- ARRL, The Doctor Is IN (Room 2)
12:15-2 -- Ham Radio and the Law (Room 3)
12:45-2:15 -- D-STAR Forum (Room 1)
1-2:15 -- Alternative Energy Forum (Room 5)
1:30-2:30 -- ARRL, Public Relations (Room 2)
2:15-3:30 -- Gordon West (Room 3)
2:30-5 -- Antenna Forum (Room 1)
2:30-5 -- Software defined Radio (Room 5)
2:45-3:45 -- Foxhunting Forum (Room 2)
3:45-5 -- Techniques of the Best Operators (Room 3)
4-5 -- County Hunting Forum (Room 2)

Saturday, May 16
9:15-11:15 -- Contesting Forum (Room 1)
9:15-10:15 -- SATERN Forum (Room 2)
9:15-10:15 - Lightning Grounding Forum (Room 3)
9:15-11:00 - VHF/UHF/Microwave Forum (Room 5)
10:30-11:30 -- ARRL Members Forum (Room 2)
10:30-11:45 -- Heil Sound (Room 3)
11:15-1:30 -- AMSAT Forum (Room 5)
11:30-1:15 -- Youth Forum (Room 1)
11:45-2 -- Newsline Town Meeting (Room 2)
12-1 -- RTTY Forum (Room 3)
1:15-2:15 -- ARRL, Digital Contesting (Room 3)
1:30-2:30 - ARRL Presents Richard Garriott, W5KWQ (Room 1)
1:45-3 -- SSTV Forum (Room 5)

2:15-3:15 -- FCC Forum (Room 2)
2:30-3:30 -- ARES Forum (Room 3)
2:45-5 -- DX Forum (Room 1)
3:15-5 -- MARS Forum (Room 5)
3:30-5 -- ATV Forum (Room 2)
3:45-5 -- Collins Forum (Room 3)

Sunday, May 17
9:15-10:15 -- Red Cross Forum (Room 1)
9:15-11 -- QCWA Forum (Room 2)
9:15-10:15 -- Volunteers and EmComm Forum (Room 3)
9:30-11:15 - Bicycle Mobile Forum (Room 5)
10:30-11:30 - When All Else Fails, South Carolina Is Ready (Room 1)

For more information on forums at the 2009 Dayton Hamvention, please visit the Dayton Hamvention Web site <http://hamvention.org/forums.php>.

From: kc7cjo
Topic: 6047 Message: 6047

HB2377 is one of the mobile communication bills in the house that impacts Ham radio, and it is heading to the House Floor for a vote in the next 7-10 days.

We need your help TODAY to try and defeat this bill. The only exemption for Ham radio in the bill is during emergency or public service activities.

Please write your representative and ask them to vote against the bill for the following reasons:

1. It is poorly written. The bill seeks to keep people focused on the road but still allows people to takes their eyes off the road to dial and program their phones.

2. Even Representatives on the committee were unsure during the Work Session if the bill does what it is supposed to. Some believe could be interpreted to exempt texting while others read the language differently.

3. One clause in the bill, allowing "activating or deactivating a mobile device", is so vague it could allow nearly any activity depending on how the phrase is interpreted.

Because the bill is so poorly written, at this point it is not necessary to be concerned about the effect on amateur radio in your arguments to your State Representative.

You can find your legislator by visiting this site:
http://www.leg.state.or.us/findlegsltr/

You can email your legislator directly from this form:
http://www.leg.state.or.us/writelegsltr/

NOTE: Please keep your arguments against the bill confined to the points above. It is important to send a unified message, and to send a message that has the best arguments against the bill. Remember, the goal is to get a NO vote from members. At this point, the best argument for a NO vote is that the bill is poorly written and vague. An argument solely based on Ham radio's concerns is not going to convince
legislators to vote NO.

BACKGROUND:

Last weekend, after I sent out the section news for April, I learned that a work session with the House Transportation Committee had been scheduled for HB2377.

Normally the public is not allowed to testify at the work sessions but I attended to listen. Rep. Boone from Clatsop County, was concerned about how this would affect the ham radio operators so the chair of the committee allowed me to come up and answer her questions. So the fact that some of the Representatives recognize me and know I represent amateur radio has some benefit.

I expressed my concerns about the issues with the bill. It passed the Transportation Committee with the amendments anyway. Rep. Tomei claimed that all my concerns were

addressed. Rep. Boone came back to talk to me after the work session and said she would make sure my concerns were addressed in the final wording. I again expressed my concerns to her.

We will continue working on the floor of the House, and on the Senate side if it passes the House. Since there is a tight timeframe, there is likely to be a lot of opposition on the Senate side, and there were so many 'no' votes from the House Transportation Committee, there is a very good chance that a mobile communication bill will not pass this session.

Kevin Curry, KA7KYQ, recommended to me that I work with a specific representative who is sympathetic to our cause and have a "floor letter" distributed to all House members when it comes to the floor of the House. I will begin working on that.

If it passes there, we will immediately begin working with the appropriate committee on the Senate side. The Senate President is most likely going to assign it to the Senate Business and Transportation Committee.

Please be assured that we are watching the bill. Many times when there is movement, we have very little notice. This is particularly true late in the legislative session. But either I will be at any hearings and work sessions or I will make sure someone is there in my place. In addition I am building a list of primary contacts around the state for each representative and senator so I can make sure we can quickly make a quality contact from every district. If you want to be my primary
contact, please let me know who your representative and senator is.

I will be working on getting a "floor letter" distributed and beginning to make contacts with appropriate senate committee members.

I will keep you updated.

The old Heathkit HD-4040 will run KISS if you replace U12 with the
"TNC 1 KISS" eprom. I have one and it works fine with UIView.
I don't remember where I got the eprom but it was probably from TAPR.

Why not just download a free copy of AGWPE and anyone of several free or low cost mapping programs? All you will need besides your computer with a sound card is a patch cable to go from your radio to the microphone or line input on your PC. You can buy an attenuated patch cord from Radio Shack, or better yet, build a simple homebrew cable with an isolation transformer. The AGWPE program will decode multiple baud rates, and is much more forgiving of weak signals than ancient modem chip technologies. Of course, its hard to beat sites like openaprs.net or aprs.fi for just monitoring.

Ron,

Depending on the area you are in, the 3 dB whip antenna included with the Micro-Trak AIO may be okay for your application. I suggest you use a right angle SMA adaptor if you go this route, since it will allow you to lay the Pelican case flat, and have the antenna oriented vertically. Adding an external antenna is preferable. FYI, the newest MT-AIO's also include an internal regulator so that you can wire in a cigarette lighter adaptor and power the unit from vehicle power. This is ideal if you are going to use Smart Beaconing, since the GPS stays powered on constantly in this mode. (ordinarily, we put the GPS to sleep to save battery power until a scheduled transmission) You can shut the lid on the Pelican case over a typical CLA wire pair, and this will keep you from having to drill a hole (cringe!) in the water-resistant enclosure.

> what is some ideas for doing aprs?

Well, the real joy of having APRS is so that you can see all the other mobiles and ham radio activity around you. When you can see them, you can also see what frequency they are talking on (voice) and so you can QSO them as well. This requires a 2way APRS radio. And since these radios are selfcontained, then taking it in and out of the truck is as easy as any other radio. Simply disconnect Power and Antenna and keep the radio with you.

If you install just a tracker, then there is no real benefit to you as a ham operator. You are just driving around broadcasting your position, which is pretty boring, especailly since you cannot then use it to communicate with other fellow ham drivers and you cannot see anything around you.

But the APRS radios are not what I woiuld call "innexpensive", but they do bring all of the beenfits of APRS to you the mobiel operator. To see the kinds of things you can see on your APRS mobile display, see www.aprs.org/localinfo.html

From: Alan
Topic: 6054 Message: 6054

Hello! Like many of the members of this group, I'm just now getting interested in APRS, among other digital comms.

I'm trying to familiarize myself with how APRS works, and I'd like to set up a mobile station, both with a laptop for APRS/packet and a GPS for tracking. My question is, can the station be connected in series as follows:
[GPS]---->[Laptop]---->[Soundcard Interface]---->[Radio]

All of the diagrams I've seen have EITHER a laptop connected OR a GPS.

Also, since I'm asking questions, I'm thinking of purchasing a Signalink USB soundcard interface for the above setup. Good idea?? Any opinions or comments are greatly appreciated.

Thanks in advance and 73 de Al K1SAV

Ron,

FYI, the person you are talking about is Bob Bruninga, the father of APRS. I don't think that Bob thinks that APRS is worthless if its just uni-directional, he just sees that you are missing a lot of the potential capabilities of APRS, about which he is rightly enthused. Lots of people just want the wife and kids to be able to look in on them and know where they are in the world, and I don't think anyone wants to take away from that. I hope after your MT-BFT, your next purchase will be an MT-TT4! I have been having great fun today sending e-mails from the new code Byon wrote for it using a mini PC keyboard and an LCD display. I am way too old to try and use a cellphone to send text messages while driving! Married to my Avmap G5, I think I have the coolest mobile system around!

That sounds like a receive only solution. I'm looking for something
that will allow me to beacon my position also.

I think Ill order a KISS chip for my TNC and build a cable to connect my
radio.

Thanks to everybody that responded. I'm always open to help.

> Why not just download a free copy of AGWPE and anyone of several free or low cost mapping programs? All you will need besides your computer with a sound card is a patch cable to go from your radio to the microphone or line input on your PC. You can buy an attenuated patch cord from Radio Shack, or better yet, build a simple homebrew cable with an isolation transformer. The AGWPE program will decode multiple baud rates, and is much more forgiving of weak signals than ancient modem chip technologies. Of course, its hard to beat sites like openaprs.net or aprs.fi for just monitoring.

Hi Kevin,
AGW sound card does both TX RX and the interface requires 2
audio transformers and opticoupler and a few other assorted
items ..

Ring your local PC shop and ask if they would swap you 2 old internal dail
up modems for a couple a packets of chocolate
biscuits and you can use the Txfmr and the 4n33 and some of the other bits
off it .

I have been interested in APRS for some time. I think I would like to at
least set up a station in my shack where I can pick up APRS packets off the
air and map them. What software and hardware do I need? I have an old
Heathkit HD-4040 TNC. Can I use that or will I need to buy a new TNC? I plan
on making a cable to connect to my radio. Any help would be greatly
appreciated.

We are useing Kantronics KPC3+ with ver. 9.0 software.
Is there a way using UIDIGI to trap or block any one useing a path grater than wide2-2? If not UIDIGI is there another way?

Yes, set UIDIGI to WIDE3-3, WIDE4-4, WIDE5-5, WIDE6-6
And that will get most of them. But not the clever
intentionally abusive person who knows how to get around it.
Also, did 9.0 add any commands to trap lareg N's?

Bob,
Your example is how I have it set up but I still see packet frames, mainly from other digi's, that our digi will repeat with wide3 and grater. How about other parameters such as uidwait. I have it off.
Here are the other parameters I use.
uiflood wa, 30, ID
uitrace wide, 30
unproto apn390 via wide2-2

I am rather new at APRS so I am not sure what you mean by large N's.
Can you give an example?

Your digi is just your piece of the pie. Using the UIDIGI COMMAND as a trap, assumes all other digis are also set up as new-N paradigm digis and are also trapping. If there are packets coming through into a N=2 recommended area, then the problem needs to be fixed in those areas where they are originating, not try to trap after the fact.

Simply look at the path where the packets are coming from, the FIRST digi is responsbile for trapping big N packets. It should be simple to identify that first digi and contact the sysop and get it fixed. If users are using N=4 or larger, then you should consider getting in touch with the individual user and educating him carefully on the proper settings for APRS in your area...

> How about other parameters such as
> unproto apn390 via wide2-2

No, that is incorrect. Can I ask where you are finding these settings?

The UNPROTO is not used for the TNC's own ID beacons, the UNPROTO path is used for the path for the locally-recommended-voice-repeater-frequency object which should be in the BTEXT. Please see www.aprs.org/localinfo.html

The proper settings for a KPC3+ TNC are found on the www.aprs.org/fix14439.html site. The beacons from the digi use the proportional pathing algorithm which use the four LTexts, BLT's and LTPaths to make beacons more often locally and distant beacons less often.

> I am rather new at APRS so I am not sure what
> you mean by large N's.
> Can you give an example?

Yes, anything over 2 is considered a large N in most dense APRS
places. A few places might allow 3 hops with N=3-3, but those
places should be more than 3 hops away from any major city or
metropolitan area, and that usually means a hundred miles or
more...

If you have any more questions, please feel free to ask.

Ok. Now I understand I can't block wide3's or larger if they are originated by a digi that
will accept them. Educating some folks around here will get you black eyes and abusive
mail. They were here first and know what they are doing. I am going to leve that one alone.

> > How about other parameters such as

We could probably drop the via widexx. We have no BT. Objects are put on from our igate.

That is still not right. Local Frequency objects should NOT be originated at an Igate or any other home or fixed location other than the DIGI. There are many reasons that are enumerated on the www.aprs.org/localinfo.html web page:

1) Igates often have more than one hop (which is bad in most areas).
2) Using even 1 hop on an object creates SPAM Objects beyond the local area
3) Objects from anything other than the DIGI itself DOUBLE channel QRM for objects
4) The IGATE or home station cannot hear what the digi can hear
5) so ONLY the digi can originate the local FREQ object without any collisions.
6) only the digi can originate a local object with NO impact on the network
7) by definition, a local frequency object is associated with EACH digi, not with each voice repeater. The purpose of the frequency object is to inform users in the footprint of that DIGI (not the repeater per se) of what frequency is receommended in the area of that DIGI. Thus the single most recoemmended frequency for that digi's coverage area is supposed to be originated at the digi. Because only its coverage area matches the definition of the object.

I will admit that such objects could be originated at an Igate or a home station, but it is only half as efficient as being at the digi, and it takes careful settings to make sure it it not just SPAM in areas where the repeater cannot be used directly. We do not generally see people taking the care to get all those pieces together. The DIGI Btext has no other use under the New-N paradigm other than the receommended frequency object for its coverage area. That is what it is there for.

Good luck
Bob, WB4APR

Tom
We as a club supported the Abraham Lincoln Council Boy Scouts of America Lincoln Trail hike with APRS this year using approximately 25 stations and supported by WIDE3-3, when used in an operation that requires alot of tracker and fixed stations that is the way to go to maximize the effectiveness but if I were to use it as a tracker on the open road I would use both WIDE 1-1 and WIDE2-2.
73 and enjoy your trip

Your points are well made and well taken. I am useing UiView for my igate. Putting up objects was just easy to do with UiView. I will see if I can figure out how to do it from the digi.

Thanks

I found the following information on how to add objects and it is very clear.
BEACON EVERY 10 . . . . . .(every 10 minutes)
UNPROTO APN383 . . . . . (For a KPC-3+ version 8.3. Note, no hops!)
BTEXT ;FFF.FFxyz*111111zDDMM.hhN/DDDMM.hhWrTnnn RXXm NETxxxxxx MTGxxxxx .....

Is the IRLP and Echolink information in the format,IRLP-NNNN and EL-NNNNNN, added to the BTEXT? If not where?

Thanks
Wayne, WA5LUY

> NETxxxxxx MTGxxxxx ....
>
> Is the IRLP and Echolink information in the format,IRLP-NNNN
> and EL-NNNNNN, added to the BTEXT? If not where?

Good question. The above is a FREQUENCY object which should be used to alert Travelers to the best receommended voice repeater for voice contact in the area of this digi. Often this repeater may have echolink or IRLP connectivity too. In that case, add the EL-NNNNN or IRLP-XXXX after the RXXm.

If the Echolink or IRLP objects is not the most recommended voice contact frequency and if the primary use of the repeater is for Echolink contacts, then use the EL-NNNNN or IRLP-NNNN nomenclature for the object name and put the FFF.FFFMHz in the obejct commetn field.

BTEXT ;EL-NNNNNN*111111zDDMM.hhN/DDDMM.hhWrFFF.FFFMHz
Tnnn RXXm ...

Enjoy!

Subject: [tapr-announce] Reminder: Sign up now for the 2009 TAPR/AMSAT Banquet at Dayton Hamvention

Time is running out! Orders for Banquet tickets have to be made by Monday, May 11 -- no exceptions!

2009 TAPR/AMSAT Banquet at Dayton Hamvention

The third annual joint TAPR/AMSAT Banquet will be held Friday evening,
May 15, 2008 during the Dayton Hamvention.

The Banquet will be in the Jefferson Room at the Kohler Presidential
Banquet Center, Kettering, OH (just south of Dayton).

Reservations are required and must be made by Monday, 11 May 2009.
Seating is limited, so make your reservations early.

TICKETS WILL *NOT* BE AVAILABLE AT HAMVENTION; YOU *MUST* REGISTER IN
ADVANCE!

The price for the Banquet is $30 per person. Reserved tickets may be
picked up at the AMSAT booth at Hamvention on Friday, or at the door.

You may make reservations for the 2009 TAPR/AMSAT Banquet online in the
AMSAT Store or contact Martha at the AMSAT office. You can reach Martha
from 10:00 AM to 6:00 PM EST/EDT at (301) 589-6062, or in the US toll
free at (888) 322-6728.

For additional information contact Martha at the AMSAT office
(martha@amsat.org).

6:30 PM Doors open and Cash bar is available with Beer, Wine, Liquor and
soft drinks.

7:15 PM Buffet Dinner service begins. The Center has a justly deserved
reputation for good food and service.

6076. Newb setting up OpenTracker+, a few interface questions

Yahoo group: APRS (2007 — 2010)
Date: 2009-05-12 05:46:07 UTC
From: trialexhill
Topic: 6076 Message: 6076

Hi.

I'm setting up an interface to an OpenTracker+. I'm not the licenced user, and don't have access to it at the moment.

I was hoping to please ask a few questions to clarify the three levels of interface requirements.

I have tried searching the web and this yahoo group but I can't find all of the info I need.

The OpenTracker+ manual has a lot of good stuff, but hoping for a few more pointers.

[1] Harware Interface: I know the hardware interface required is a female DB-9 to mate to the onboard male DB-9, TX/RX/GND on 2/3/9.

[2] Electrical Interface: Is the OpenTracker expecting the GPS to output true RS-232 levels (+/-12V) or can it deal with +5V/0V (or even +3.3V/0V) TTL levels?

[3] Signal Interface: Which NMEA sentences is the Opentracker+ expecting, and at what baud rate? The manual shows how to set the baud and update rate the OpenTracker+ will transmit to the radio, what update rate should I set the GPS to output?

Thanks heaps for your help, apologies if this info is obvious somewhere else.

Alex

CSS to Debut New APRS Touchtone Software at Hamvention

Radio Spotter™ Software Planned for Release in the Summer of 2009
Creative Services Software, Inc. (CSS) will debut Radio Spotter, a coming addition to its radio software product line, at Hamvention in Dayton, Ohio later this week. Radio Spotter is the industry's only software for APRS® touchtone-to-packet communications. The software receives and decodes DTMF (touchtone) transmissions, converts them into an APRS packet and transmits through the APRS system.

A beta version of Radio Spotter will be demonstrated by CSS in Booth 108-109 throughout the convention, and by APRS Founder Bob Bruninga, WB4APR, during the APRS forum on Friday, May 15. Radio Spotter is a licensed implementation of the APRStt™ specification as developed by Bob Bruninga, APRS Engineering LLC, and has been certified as compliant. The software will be released in the summer of 2009.

Radio Spotter is an APRS touchtone (DTMF) gateway that monitors a radio for operator DTMF transmissions on a simplex frequency such as 146.58, decodes the DTMF into an APRS packet, and then transmits the packet on the national APRS frequency of 144.39. A voice or morse code response to the DTMF is sent back on a second radio on the DTMF channel. In addition, Radio Spotter offers an interactive dashboard and command center for monitoring and managing DTMF receive and APRS transmit conditions, logging transmissions and controlling the attached TNC or soundcard.

The software will run on any Windows PC, laptop or netbook (with Windows 2000 or later) and requires only a soundcard or TNC to connect to a radio transceiver. Optionally, operators can connect to multiple soundcards and/or multiple TNCs. Using Radio Spotter with the Radio Operations Center (ROC)Digital Desktop™ from CSS, along with multiple soundcards or a dual-port TNC, allows operators to continue running Radio Spotter while using ROC Digital Desktop to work other modes and frequencies on the HF port.

"Radio Spotter allows anyone with any HT or mobile radio to check in on APRS and become part of the global APRS network," Bruninga said. "Just store your call sign in DTMF format in a DTMF memory and you'll appear on APRS with just the press of a button on any existing VHF radio with a keypad."

"Operators key in their call sign and position in seconds, and Radio Spotter logs their call sign, location and the time their DTMF was received," said Rick Ruhl, W4PC, president of CSS and software developer. "Simply connect a PC running Radio Spotter to a radio transceiver and nearby operators can check in to APRS with only a handheld VHF radio."

Radio Spotter will serve the routine communications needs of an emergency response team, local club or area, and is an ideal application for special events. With Radio Spotter operating at a special event, not only the APRS volunteers, but now all volunteers with nothing but an HT or mobile with DTMF can report their positions via the APRS system.

"With Radio Spotter, all ham radio operators can participate in the APRS information system, not just those with specialized APRS radios or those with mobile TNCs and laptops,"

Bruninga continued. “This lets the other 95 percent of amateur radio operators exchange useful data for special events or emergency operations with the APRS system and other users.”

Visit www.cssincorp.com for more information, or to sign up to be notified when Radio Spotter version 1.0 is released.

About the Radio Operations Center

The Radio Operations Center software suite from CSS is the only amateur, MARS and commercial radio software solution that combines the integration, automation and multitasking capabilities of Microsoft® Windows with the flexibility and control to operate on multiple TNCs, soundcards and radio hardware in all the digital modes. The Radio Operations Center allows users to control radios, TNCs and rotors, as well as access logging applications, call books and more. The software formerly known as PKTerm™ (for Timewave/AEA TNCs) and PacTerm™ (for Kantronics TNCs) are now called the Radio Operations Center (ROC) Digital Desktop™. Other Radio Operations Center products include EmComm Ops, Marine Radio Ops and Weather Ops.

6078. Pciking a non-APRS frequency

Yahoo group: APRS (2007 — 2010)
Date: 2009-05-14 12:31:21 UTC
From: riverridge@centurytel.net
Topic: 6078 Message: 6078

Hi.....

Newbie here. This maybe should be on a "non-APRS" mailing list, but this is the closest I know about.

I would like to demo some packet radio devices in the south suburbs of Minneapolis/St. Paul without loading the APRS frequency, 144.39. Unfortunately, I am not there (so I can't just pick one and listen) and I would like to program the devices prior to arriving.

How should I go about picking a 2m frequency that is likely to be clear that I won't disrupt too many others?

Many thanks for your thoughts.

You can go between 146.405 to 146.595 and also between 147.405 to 147.595...
last I heard, those were simplex frequencies in most parts of the US. :-)
HOWEVER, pick a few frequencies, listen to them for a while first, and also check
your local repeater bandplan, just to be safe. :-)

If it's just packet stuff you're doing, stick with the bandplan and
use 145.01, 145.03, 145.05, 145.07 or 145.09.

If you don't hear anything specific, pick one or two of the upper frequencies. 145.01 is still pretty commonly used and .03 gets some traffic as well. Typically, as packed died down, the upper frequencies became less nessary.

Good luck,

Mike

Hi Jim,

Try this website for MN packet info.
<http://wb0tra.no-ip.org/mn_pkt.php>
The OM that maintains the site might be able to provide a
contact local to the Twin Cities if his QTH is not.

Best thing to dop is check with your local repeater council and see what thier band plan is for digital packet frequencies.

From the specifications I manage to find on the Internet, the N?vi 750 doesn't have a NMEA connection, only USB. In order to communicate with e.g. the Kenwood Tx-D7xx radios, it will need a serial port and NMEA communications protocol.

What happened was someone did hear your station transmit, and it was
timed just right, for their packet to piggyback yours, so it looked
like a comment on the end of your aprs packet.

I guess your going have to transmit a position packet with a comment,
I'm not sure exactly what the opentracker+ transmits in weather mode
for packets, but using any aprs internet enabled program you could
inject a packet into the internet to clear it out.

Quoting Rob <robd@...>:

I think this is an OpenTracker question rather than aprs.fi question.
You may want to ask in the OpenTracker Yahoo group.

The data presented by aprs.fi comes from the APRS-IS servers. Your
beacons are stored in the servers and they got there because they
were transmitted by your station.

Bob...

I think you are exactly correct as to how it happened. There is a digi around here that is munging packets sometimes.
I will repost the question over there.
Thanks

Hi,

Any GPS which outputs data in the NMEA format. The Nuvi series, outside of the 350, does not, as far I I recall. The 350 must use a recently marketed converter cable. You can check the TM-D710 group for more info - I can't recall the cable name/site, etc.

I own 2 710s and have used: an old Garmin GPS III+, a 60CSx, a StreetPilot III and now use a 376, which I also use as my XM radio/XM weather interface.

So, any GPS which outputs NMEA data - the "auto-centric" GPS units usually do not. It is the older portable and marine-centric units which do.

You can also use what is called the GPS-710 - a mini-GPSr designed by a member of the 710 group. It is very small and cables directly to the Kenwood. All that it lacks is a display. If you don't want the display, the GPS-710 is the way to go. You can find it at greenlightlabs.com. I have not used this unit, but many other members of the 710 group have and they love it.

Lastly, you can use a Delorme or Garmin hockey puck type serial-based GPSr - again - no display.

The main advantage of the AVMap G5 is it's software's tight integration with the Kenwood 710 - that and tactical mode (where you can select an APRS object and focus on it and track its movement).

Distance estimates are always frustrating. This is a 500 mW module (the same module is used in the Rtrak, which is Opentrak powered) This power level is useful as an air-to-ground transmitter, as used in meteorological balloons, and in ground to mountaintop transmissions in clear areas. I find I can hit digis with our MT-TT4 transceiver (500 mW's running without the power amp) at ranges of 40 miles with a good antenna, downhill, and with the wind on a good day. For ground to ground transmissions over anything but totally flat terrain, a couple of miles is to be expected. You need a pretty good signal at the receive end to decode Ax.25 data, and there are lots of competing stations generating noise to fight against (this on the primary APRS frequency. You can find a quieter spot for your own purposes) I think the transmitter module would be a good choice for an area with solid digipeater coverage, or airborne. If it turns out to be too anemic for your purposes, and you can't get enough improvement with improved antennae, you can use the module as an exciter for a larger power amplifier.

Thanks for all the replies: I went back to take another look at the AvMap G5,, even though it works with the 710, and as expensive as it is, it appears to lack some of the features the the new Garmin Nuvi's has, such as lane assist, etc, as I am going to buy a new GPS, I would be willing to pay the premium price if it had some of those features. They don't seem to be discounted much. $1200.00 is quite a stretch for APRS

What format of maps does it take? APRSdos? PocketAPRS? APRSce
only? I can point you to some APRSdos and PocketAPRS maps that are
still out there.

The browser that is loaded on the BB does not support Java. The workaround is to load Opera Mini on your BB, as it DOES support Java. From your BB, do a Google search for Opera Mini. You should find a link to download and install it.

Hi Curt,
Thanks for the response.

I looked at the "Williamson.map (Texas County) and in the first few lines of this (binary) file it says

TGR 1.0 Williamson.map <some binary data> Sproul

Understanding that Mark Sproul is one of the creators of WinAPRS The TGR prefix drove me to think this is a TIGER-based file.

I haven't tried a bunch of map formats but APRSCE does run:

*.map (i.e. Williamson)
*.pdb (these are pure text files)

I'd like to get some of the surrounding counties (Travis, Burnet. Bastrop) and figure I may need to create them myself. Sure would like a format doc for the "*.map" or whatever will get me high coverage at the street level.

Ironically, I have the TigerMaps running on WinAPRS for these counties, but it leaves them in the Tiger format.

Hi,

I just picked-up a KPC-9612 (non-plus) from ebay. It has the original firmware installed. I'd like to upgrade the firmware to the latest (8.2), however Kantronics doesn't support it anymore. Could someone help me out? I have the ability to burn proms. I just need the image file. Thanks.

I'm selling a Garmin <> Kenwood interface cable of my own design, but I don't have one yet with the 18 pin connector that the nuvi 750 uses yet, and in any case the 750 won't display waypoints, or at least not yet. Maybe Garmin will make that possible later - it worked on earlier models.

Generally speaking, Jan is right - the Kenwoods need NMEA and recent Garmin models don't do NMEA. My cable translates between NMEA and the Garmin fleet management protocol.

> like a comment on the end of your aprs packet.

That shouldn't ever happen - it's not a timing thing, the packets have frame end markers in them and their own frame check sequences.

What's more likely is that someone's running an IGate with a TNC in converse mode and it dropped a carriage return or something if you're seeing concatenated packets. The TNC heard the packets separately, but the IGate misread the TNC output.

> true RS-232 levels (+/-12V) or can it deal with +5V/0V (or even
> +3.3V/0V) TTL levels?

It'll work down to the gate threshold of the 2N7000, about 2.2 volts I
think.

> [3] Signal Interface: Which NMEA sentences is the Opentracker+
> expecting, and at what baud rate? The manual shows how to set the baud
> and update rate the OpenTracker+ will transmit to the radio, what update
> rate should I set the GPS to output?

It'll work with any combination of GPGGA, GPRMC, and GPGLL.

If anyone else needs the KPC-9612 v8.2 binary, I have a confirmed working file. I can email it to you.

Just go to http://solasprime.com and click the "contact us" link at the top of the page, or elsewhere on my page.

>
I found another wx stn that was sending a regular comment and figured out the syntax. I then set my KPC-3 up to emulate the wx station and sent a single packet with the correct Comment and now all is well.
I have also modified my upath to avoid the digi or gateway that is messing up the packets.

> *.map (i.e. Williamson)
> *.pdb (these are pure text files)

*.map should be APRSdos, WinAPRS, or MacAPRS maps. There should be quite a few of these available all over the 'net. Try tapr.org for a start. I have a few, but probably not of the state you're interested in. The counties don't sound familiar anyway (I'm in WA).

*.pdb maps are PocketAPRS maps. Those are for a PalmOS-based application that is no longer available (but lots of us still have it running). I also have a few of these for testing.

Xastir can handle these types of maps plus many others, so I have examples of each of these around but not a complete collection. Some of the U.S.-wide or World-sized maps may be of interest to you though.

> I'd like to get some of the surrounding counties (Travis, Burnet.
> Bastrop) and figure I may need to create them myself. Sure would
> like a format doc for the "*.map" or whatever will get me high
> coverage at the street level.

The APRSdos and Xastir source code is available. APRSdos is written in BASIC, Xastir is in generic C. You can glean the info from there for the format of *.map files. For *.pdb look at Xastir.

> Ironically, I have the TigerMaps running on WinAPRS for these
> counties, but it leaves them in the Tiger format.

Xastir handles Tiger format as well, but it is slow. The new Tiger data is in Shapefile format, which is quite fast, and we have 2008 data available for Xastir now in that format. I'm using that or the online Tigermap server for my maps currently.

Try this site, and in particular try any TAPR or TAMU links:

http://www.xastir.org/wiki/index.php/Xastir_Maps

6120. Need suggestions for a portable APRS Antenna

Yahoo group: APRS (2007 — 2010)
Date: 2009-05-21 19:26:04 UTC
From: riverridge@centurytel.net
Topic: 6120 Message: 6120

Hi, all.....

I am looking for suggestions for a portable antenna for APRS field operations. I found a telescoping paint roller handle that extends to 24 feet ($40). I was thinking of building a hard copy copper tubing J-Pole antenna to mount on the top and then some brackets to use the car/truck for support of the telescoping handle. I have found several sets of plans for a J-Pole on the internet that don't look too difficult, even for a newbie like me. (I can solder water line better than I can solder electronics!)

My hope is that getting the antenna up in the air 24 feet and using a J-Pole antenna will dramatically increase my range over a 1/2 wave mag mount on top of my car.

Am I overly optimistic? Does anyone have a better suggestion? Unfortunately, money is an issue <frown>.

Remember to take your passport. Or one of the new fancy drivers
licenses that will let you back in. Rules have changed for travel
to/from Canada.

You may be a little overly optimitstic since a standard j-pole doesn't offer any more gain than a half wave mobile (since it IS a half wave antenna) but the extra 24' will help compared to the mobile assuming you use good coax (no RG-58)

For a bit more gain lookup the "Super j-pole" design by N7QVC. I've built several of that version antenna and have had pleasant results.

good luck and happy building!!! "newbie" or not, building your equipment is always a worthwhile thing to do.

Location, Location, Location... Height above average terrrain in the direction of the digipeater is the single most important paramter of any link. So a jpole (dipole) on a 24 foot mast shouid pick up abotu 6 dB of height gain (you get 6 dB for every doubling of height). But for practical purposes, a mobile antenna is generally assumed to be about equivalent to 10 feet above average terrain, hence the 6 dB improvement.

Getting above surrounding objects has even more advantages...

Bob, WB4APR

6124. Re: [APRS] Need suggestions for a portable APRS Antenna

Yahoo group: APRS (2007 — 2010)
Date: 2009-05-21 20:47:24 UTC
From: Greg Clark
Topic: 6120 Message: 6124

I built a base for attaching a telescoping antenna like this to my car.

I took a 2 foot long by 4 inch wide piece of flat steel, and drilled
and attached a threaded pipe bracket to it, and then screwed in a
piece of 2 1/2" diam galvanied pipe to form a T. Then park the car on
one end of the T and slip the telescoping extension pole into the
pipe. For stability, I used some PVC and velcro to make a bracket
to attach the pole to the roof rack

Cheap, very quick and easy to set up / tear down, and very stable.

How'z about a colinear array with multiple elements made from coax?
All you need in that case is some coax, a soldering iron, and some
non-conductive tubing to put it inside. Should survive being
battered around in a car while mobile quite well, then erect quickly
without having to worry about metal things sticking out and getting
damaged (radials, J-pole small element), etc. The more coax
elements you add, the more gain you get. They're really quite
simple to build.

Something like this but for cut for 2-meters instead:

That sounds good, Curt, but did I make an order of magnitude problem
or would it make a 45 foot tall antenna?

(8 seg)*(300)/(144.39MHz)/(2*Vel Fac of coaxof .66) = ~500 inches

The article talks about using RG58/U. Is there coax with much
higher velocity factors? Does it have to be strung out straight or
could you loop it? Remember... this is ignorance talking... please be
gentle....

6128. Re: [APRS] Need suggestions for a portable APRS Antenna

Yahoo group: APRS (2007 — 2010)
Date: 2009-05-21 21:01:28 UTC
From: Bruce Campbell
Topic: 6120 Message: 6128

I'm a little worried about the use of a J-Pole as a portable antenna in general. They are inductively coupled and react to metal objects in the near proximity. I have seen portable J-Pols but I am not convened that they are the best approach.

You don't need 8 segments... ;-)

Try calculating backwards from what is a tolerable length and then
using that many segments. You can also go with coax that has a
lower velocity factor (which I think is what you calculated for
anyway) to shorten the antenna a bit.

> (8 seg)*(300)/(144.39MHz)/(2*Vel Fac of coaxof .66) = ~500 inches

> gentle....

Yes there are foam coaxes with 0.8 velocity factor, but you want
lower velocity factor to make the antenna shorter (do the math above
with 0.8 instead of 0.66).

No, you can't loop it without affecting the pattern greatly. Needs
to be straight or near straight. I've heard of people hanging these
from trees or from ropes between trees for base installations.

OK.... so do you need to do it units of 2 ... ie 2 or 4? 2 units
would give you a total of 12' feet (using .8 Vf coax) . Could I carry
that in 2 6' section of pvc with the coax folded and straighten it out
and lock the two section together? How tight a radius can you bend
coax?

Ok this is one option..... general concensus is that a J-Pole is
not a good plan.... a Super J-Pole seems to have too much "stuff"
hanging off it to be robust....

What is the next best option ? High gain.. portability in a car.

Many thanx..... jt

>I am wanting to connect the TM-710A to a laptop, and to a serial port gps, not sure how to do this,
>I have an aftermarket PG-5H kit What else would I need to accomplish this?

The Data OUT lead from the GPS should be connected to the NMEA IN connector of the 710.
The Data IN lead from the GPS should be connected to the NMEA OUT connector of the 710.
Common (Ground) from the GPS should be connected to the Common (Ground) of the 710. On the 710, these three are probably a 2.5 mm "stereo" jack marked "GPS" if the 710 has similar connector as the D700 and the D7.

Similarly, the Data IN, Data Out and Common leads from the plug in the "PC" jack of the GPS are connected with the TXD, RXD and Ground pins of a 9 pin serial connector.

Don't know the PG-5H kit.
The manuals of the TM-D710 should contain drawings.

From: Bruce Campbell
Topic: 6120 Message: 6134

If you plan to have trees, another option would be a super cheep ground plain. A SO-239 Chassis connector (one that won't rust) with a wire soldered to the center connector and extended for 1/4 pr 1/2 or what ever wave. then your ground plain is 4 wires soldered to the chassis screw holes. Attach some non conducting string to the ends of each line. When deployed, pull the strings tough in a tree to make a ground plane geometry. It's a royal pain to put up but it only takes up a few square inches in you go kit.

Another option is an antenna that David Campbell (KD4NOQ) in Memphis showed me how to make. I can't remember the name. Ir was basically a capacitive coupled version of the J pole. Use price of latter line 3/4 wave long. On one of the poles cut the conductor at 1/4 wave. and trim the remaining 1/2 wave off. Solder the end with both converters to a SO-239. DON NOT short the pols at the end as in a J-Pole. Put about 5 loops in the coax near the SO-239 for a poor mans balun. You may want to play with the number of turns in the coax. I have had great performance out of these. It can also be rolled up and tucked away in a small bag.

I just with I could remember what it is called. Can any one out there help me out?

6138. Problem with APRS and computer

Yahoo group: APRS (2007 — 2010)
Date: 2009-05-24 08:33:48 UTC
From: Graeme
Topic: 6138 Message: 6138

I have a problem with my system I am hoping to get some help with here. What I have is a fairly standard home computer system running Win XP and UI0view. I am using AWGPE as the tnc using the soundcard with a simple transformer interface and an FT857d.

The problem is that when I pick up a local ham who runs the local I-gate/Digi then my system fails to recognise about 90% of the traffic he broadcasts. I get his beacons, etc. but nothing else.

I have now set up a TNC in parallel so to speak, using a TinyTrack4 in kiss mode. I can switch across between the AGWPE port and the kiss/tt4 port. On the AGWPE port it is as I have described. On the kiss/tt4 I get full decode with no missing packets. Which effectively eliminates most of the setup for Ui-view as a cause for the problem.

Does anyone on this group have any ideas as to what might be causing the problem?

Graeme

Could be:
*) Twist (difference in level between high tone and low tone). Some
modems handle twist better than others. You'll often see this
problem between Kenwood APRS transmissions and other devices as
the Kenwoods transmit "flat" while most everything else transmits
with pre-emphasis.
*) Noise in the soundcard input or processing.
*) CPU too busy causing sampling to suffer.
*) Difference in sampling rates between what AGWPE is requesting and
what the soundcard hardware can provide.
*) Different audio level needed between the two setups.
*) DC levels messing up your soundcard input? I think most
soundcard inputs are capacitively coupled though.

Perhaps others can suggest more reasons. I'm sure I didn't think of
them all.

You will have to enter an "Extra Logon Text" as well. If you have set
your position in UI-View, the filter could be "filter m/500" (no "" in
the filter text!) and you will get all stations within a radius of 500
km from your qth.
As long as you use a server port 14580, the server will not send
anything before you have set a filter.

de nada :)

>I Wrote in spanish because I committed an error about the e-mail address. I
>tried to write the e-mail to the local aprs group.

Well, I think I managed to understand the core of your question (I
cannot speak spanish; I just understand some phrases).

I hope you have seen yourself on aprs.fi now! (searching) no - you
aren't there! (more search: at http://argentina.aprs2.net:14501 I
found lu3dhr-2, you are using the filter a/44/-11/36/-2
a/42.28/-2/37/5 r/22/-107/970 r/-30/-75/6100 r/30/-20/500).
No, you cannot be found at aprs.fi, and not at findu.com.

aha! You haven't entered your validation code in your aprs server
setup in UI-View! The list at argentina.aprs2.net says "No" in the
Verified column. You received the code with your UI-View registration.
It's probably a five digit number. Disconnect from the APRS server,
enter the validation number, connect to the APRS server, say "Yes",
and there you should be going.

I'm not an APRS expert, but I have a couple of suggestions based on DSP experience.

1) Check your computer resource utilization.The main ones are virtual memory and CPU utilization. Easy test so I would do this first.

2) Slowly turn down the audio out levels going to your sound card to see if you are saturating the input. Again easy.

3) Download an Audio editor (I like Audacity) and record the audio cumming into the computer. You can then see the actual signal as it hits the processor.

So I'm a new Ham, bought a TT4 from Byon at Dayton. Just made up all my power cables with powerpoles. Managed to get the TT4 firmware updated, waiting on registration for UView32.

I need to pick out a GPS that'll work wonders with my new equipement. The wife and kids will be getting the GPS for me on Father's Day.

I would like a portable GPS to take while out attempting to hunt, and not get lost. Who knows maybe this year will want to find that lucky spot after getting a nice deer. (wishful thinking).

Thanking you in advance,

John KD8LDN

>I need to pick out a GPS that'll work wonders with my new equipement. The wife and kids will be getting the GPS for me on Father's Day.

Father's Day, now. I kind of imagine that that's some time in the
autumn.
>
>I would like a portable GPS to take while out attempting to hunt, and not get lost. Who knows maybe this year will want to find that lucky spot after getting a nice deer. (wishful thinking).

Give them a hint that the GPS should have a serial/NMEA port, and not
only a USB port.

I haven't used the USRadarmap in quite a while... It may not be
functioning properly from the sending side (Texas A&M University by
way of Gerry Creager).

Try WMSRadar instead. WMSRadar comes from the same place but I
have used it regularly over the last 3 months and it generally
works.

Jan,
Thanks for the reply. I did get UI-View32 registered and running. I do have an error on opening. Load Stations "input past end of file." Not sure what that is.

Also managed to get the correct firmware with config running for the TT4. Now just need to figure out how to view locations, and learn the UIview software.

Father's day is June 21st, here in the US. I see it's not till Nov 8 in Norway. Once I pick it out the kids will go with me to pick up the GPS, or watch me order online if something better comes along.

Thanks again.

From: roxieheath
Topic: 6153 Message: 6153

Hi,

I am new on this newsgroup. We have been using APRS for the last year with Kenwood D710s and some old Garmin GPSs.

My son wants to get a Garmin Nuvi - probably an 800 series and use the new Argent Data GTRANS Garmin to NMEA Translator Cable that uses the FMI on a Garmin.

However, I have not been able to find any online info about how well this will work.

Can anyone give me any help on this?

Rox

Hi Rox,

The 800 series supports the fleet management interface that the GTRANS cable uses, but there's no version of the GTRANS yet that supports the 18-pin connector it needs. I probably won't have one built until Garmin makes some firmware changes that'll allow waypoint display on those models.

6155. Garmin GPSMAP 640 for APRS

Yahoo group: APRS (2007 — 2010)
Date: 2009-05-28 20:52:58 UTC
From: Rohitash Singh
Topic: 6153 Message: 6155

Hi,

Has anyone used the Garmin GPSMAP 640 for APRS? It seems to support NMEA 0183 input/output so I'm guessing will be able to display way points. I used the GPSMap 478 earlier and it worked well. This is touchscreen and with a bigger screen. I do a lot of offroading so need something with topomap and tracks capability - so the AVMap will not fit the bill (no topomaps).

Any other suggestions for the above requirements??

a handheld one, like the GPSMAP 76* if still available, should do it
as well. Easier to carry.

I've asked Garmin about this. The answer is no, not really. It turns out the GPSMAP620/640 will only do NMEA when it's in the marine mode not the automotive mode. They also told me "only the marine mount offers the connectivity to the product's serial ports."

I think Garmin is missing a good market here since a lot of people who want to use APRS with their GPS are having to buy older units. Please take a minute (http://www8.garmin.com/contactUs/) to let Garmin know that there is a desire to have NMEA I/O available in future automotive GPS units.

From: Rohitash Singh
Topic: 6153 Message: 6158

Thanks for the info. I really do not understand why they remove functionality from their later units. Another difference between the 478 and the 640 is that the 640 will save tracks only in the marine mode, not in automotive mode. I may have to get the 478 again. I just sent them an email on that link with some suggestions.

So here's the supplement to my question. What would be the best GPS for:

Essential:

- APRS functionality (including display of waypoints)

- Topomaps

- Being able to track and save/upload/download tracks

- Automotive routing

- At least a 4" screen

- Expandable memory

Nice to have

- Touchscreen

- 5" or bigger screen

- Waterproof

- SD card

- Dual NMEA or serial port (like the GPSMap 478)

This would be the ideal GPS for people who do wheeling/back country/expedition driving and APRS.

6159. OT: APRS Operations for EOC Use

Yahoo group: APRS (2007 — 2010)
Date: 2009-05-30 02:41:51 UTC
From: Mike Besemer (WM4B)
Topic: 6159 Message: 6159

My county EC has tasked me to provide him with information regarding the use of APRS in our EOC. He's looking for something he can take to the EOC director to both describe capabilities and to illustrate what equipment would be needed.

My first thoughts regarding capability revolve around position reporting. Being able to display an icon on a map and tell the director 'I have boots on the ground here, and this is what he sees' is a great capability. Conversely, being able to see exactly where a ham is located and directing him into a specific area of interest is also quite useful.

My second thoughts are that of messaging capabilities. but honestly I don't know how much that is being utilized. Is there anyone out there using this capability in an EOC that can describe how it's being utilized?

As far as equipment, I'm thinking a good radio/TNC interfaced with UIView or WINAPRS would do the trick. Ideally, we'd have RF coverage that would cover the entire county making an internet connection unnecessary. (I think) but obviously internet would be a huge benefit. The radio/TNC could be discrete components, or something like a TM-D710.

Please give me you thoughts/advice/etc. and let me know what I've missed.

73,

Mike

For a conversation starter, you could have the director bring up something like
http://aprs.fi/?call=WM4B&mt=m&z=11&timerange=86400
on his own pc to get an idea of the coverage and density.

YOU need to know how many of your local ARES/RACES/Whatever operators are active on APRS and have a pretty good idea of their equipment and real capabilities. If people are running round with TT3's or similar, then all you can really expect to deliver is "This is where he is" -- which can still be very valuable when combined with "and this is what he reported on the voice net"

Whether or not you can get much benefit from things like status, comments, and messaging depends on both the equipment available and the operators' skills at using it. A rig like the D710 is "capable" of sophisticated messaging, but that capability is more advertising "feature" than practical function unless the operator has a laptop and software to take over running the radio instead of using its built-in features.

APRS in the EOC is somewhat of a chicken-and-egg situation, you can't use the capabilities until you have enough operators who have the hardware, software, and training - but you won't have those trained equipped operators unless there is a use for the capabilities.

To being in another clich?, what you are HOPING for is "If you build it they will come"

If someone has a spare radio, TNC, and computer available to set up in the EOC, you may be able to get space for an APRS station, but almost as much can be accomplished by running UI-view or even just a browser on one of the existing computers.

Amateur radio has many capabilities that can be useful in the EOC, _if_ you have operators ready to use them (both at the EOC and in the field). APRS, Packet, Winlink, SSTV, and even ATV all are used effectively in some places.

You need to explore the issue from both ends -- what capabilities do local emcomm hams have and how would those capabilities support the needs of the EOC.

Bob may have a heart attack when I say that resource tracking is generally the main use of APRS rather than the information passing capabilities that are part of the specification. The information passing capabilities are wonderful, if you have people able to use those capabilities - but most US hams "active" on APRS have little or no experience with anything except position tracking and most of our available APRS hardware is designed to make position tracking an easy plug-and-play operation, but messaging is

either not implemented at all or is implemented in a way slightly less convenient than stopping your car to get out build a fire and send smoke signals.

Topic: 6159 Message: 6161

Wow you□re reading my mind word-for-word!

We do have a fair start 6 or 8 active trackers in the area, but we□ll need to field 25 to 30 to be effective with it. I□m pushing the capability and trying to get folks to commit at least to adding a spare radio and an OpenTracker (or similar) to their vehicle just for this purpose.

I run the TM-D710 mobile (along with a second TM-V71), but I agree that messaging is just too painful without a laptop. I□d LOVE to see messaging exploited more, but since I have the capability to do voice on the other side of the □D710 along with the second TM-V71, I know I□d be using voice more then messaging.

We have a great club here locally about 50 active members and ARES is really starting to take off in a 3 or 4 county area. I want to use that momentum to try to build the APRS network into something more than □hey let□s watch Mike drive to work on ARPS.FI□. Tracking is neat AND useful but let□s be serious watching me drive to work gets pretty dull after a couple of days.

I agree that much could be gained simply by using APRS.FI or UIView on an existing connection in the EOC but I think we also need to (ultimately) consider worse-case scenario, where we lose infrastructure and have no internet capabilities in the EOC. At that point, RF would be our only link to the outside. Yeah I HOPE we never need it but you just never know.

Thanks much for the inputs. It□s good to hear you say many of the things that have been bouncing around inside my head since the EC asked the question. I see this being something of a phased approach, where we can stand up a certain capability almost immediately and then expand upon that as we work towards and endstate goal.

Mike,

FYI, the Byonics TT4 has a PS/2 keyboard and LCD monitor ports, which makes messaging less life threatening while you are trying to walk, run, or drive! I also incorporated these into the MT-TT4 transceiver, and Byon has code for APRS messaging working well for both.

Topic: 6159 Message: 6163

When we put together our County EOC amateur station several years ago we incorporated D-700's to have the flexibility for Voice or APRS (2, for redundancy and each has a computer attached)as needed, and so it wasn't a wasted space if APRS was not needed for a situation.

One thing that is valuable to us is the ability to get weather information from the surrounding area if (actually, for the proper paranoid mindset for planning purposes, WHEN) the internet goes out at the EOC. I've been able to track the progress of a storm front just by watching the progression of drop in temperature, increase and change in wind speed/direction, and increase in rain gauge, of each station.

So, as part of the overall package, you might want to survey how many APRS weather stations are active in your operational area. A long term goal might be to work to install stations in strategic points around the area that presently don't have one.

Good luck and 73

Fortunately, APRStt is coming and with it, 100% of your club can at least have a foot in the door to be able to put themselves on the map... with DTMF. no, not "tracking" in the routine sense, but can put themselves at a location when they have arrived and are ready for service. The advantage is that everyone has the capability for free. If it can fill a need, it is just another tool in the tool box.

> I run the TM-D710 mobile... but...
> messaging is just too painful without
> a laptop. I'd LOVE to see messaging
> exploited more...

Dont overlook the value of messaging from the EOC to the mobiles using messages and bulletins. Great for posting detailed numeric data. Mobile doesnt have to do anything but read it on his display. And everyone gets to see it in writing and not have to remember it.

> but let's be serious… watching me drive
> to work gets pretty dull after a
> couple of days.

The concentration must be on INFORMATION transfer, not just tracking. One of the primary designs of APRS was for someone at EOC to be placing OBJECTS on the virtual APRS map so that evryone, including mobiles could visualize EVERYTHING going on, not just a few trackers. But it was always assumed tha APRS mobiles could SEE info. EIther on their attached GPS maps or at least a range and bearing on their radio front panel display.

> Whether or not you can get much benefit

> the operator has a laptop and software...

Dont overlook the fact that unlike the D700 and D7, the D710 can hold 100 messages! In many cases it is trivial to simply dial down to a previous message where you have alrady said the same thing and hit EDIT/SEND. In this case, you can also pre-load several text messages of immediate value, and send with only 2 or 3 key presses...

> Bob may have a heart attack when I say
> that resource tracking is generally
> the main use of APRS rather than the

> information passing capabilities that
> are part of the specification.

Yes, but 99% of the time, 99% of us could care less where anyone else is. But at an EVENT or during an EOC evolution is the 1% of the time when it is of *great* value to everyone. BUT... the only problem is, unless you have most of your club able to be tracked, then it remains a side show and has not really reduced the voice load at the EOC substantially... because only 5% are doing it.

That is why we need APRStt. Again, you have to think OUTSIDE the narrow "tracking box". Reporting a position by DTMF is not for "tracking", it is for putting yourself on the virtual APRS map when you need to. Like when you move from one place to another, or are reporting at a station for duty.

Or, if for no other reason than to refresh your position so that EOC can see when you were last heard. AND to report if you move to another frequency. Prestore your DTMF callsign and prestore the standard operating frequencies in use in your area. Then just TWO key presses can report to everyone what frequency you are on (when you move from the main net freq). You can do this without even sending a positino report. See www.aprs.org/aprstt.html

I know what you mean when you say that sending text messages via APRS is difficult. I have a Kenwood D700 and the amount of button pushing you have to do to compose a short message is ridiculous. I found a clever box at the Dallas hamfest a few years ago that lets you type the message into the Kenwood D700 using a standard computer keyboard.

It looks like the Tiny Track 4 has an optional keyboard interface. Is anyone in this group using that to send APRS text messages?

Maybe you and perhaps some technician at Kenwood, can actually load messages
into the D710 by twisting the tuning knob a few hundred turns while pushing
the buttons on the face of the radio or by a few thousand keypresses on the
mike, but I don't know of anyone who does that from the radio in the real
world; certainly not to preload enough messages that they might want to send
in an EOC activation situation. Just setting a comment line in the 710 is
painful enough. Messaging is of very limited use without a keyboard and a
decent display for composing and reading messages.

Which requires setting up an APRStt base station and training non-APRS-equipped people to use APRStt and training APRS-equipped people to understand that the people reporting viaAPRStt are not where the map shows them and that the can't receive APRS messages etc. etc.

APRStt may be a great temporary idea to accommodate die-hard dinosaurs in an area with a very active APRS population -- right up until the time APRS trackers kill APRS the way PacketBBS stations killed packet -- but in areas with little APRS activity at all (which is most of the US, despite the pretty colored maps) I don't think we're going to seeAPRStt base stations springing up any time soon.

Our EOC we have used APRS for the VOPEX excersise for the past 6 years. The excersise come around to use every 2 years and each time it has been a tremendous improvement over the previous one.

I was the push behind starting this and each year it has been a few more features. Adding a few more digi's strategically thoughout the county.

The initial use was for position information of the field teams using winaprs. Then we started using the system to get data from the field teams and this cut the voice traffic way down.

I'm looking forward to implementing a hybrid APRStt on my voice repeater next to further expand the capabilities to the other hams in the area. This will tie the wide area voice repeater with the APRS Digi as well as a 146.580 transciever.

Maybe you don't know anyone under the age of 20 that is text messaging sun-up to bed-time on their cell phone. We have heard this complaint for 10 years from Hams who would never consider texting in a message from their HT Keypad, yet billions do it every day. That is what has held APRS back.

Text messaging from cell phone key pads has exploded an industry worth billions of dollars for youth or anyone needing the capabilty. Its amazing that 98% of hams don't seem to see any need for text messaging from handhelds...

> certainly not to preload enough messages that they
> might want to send in an EOC activation situation.

I don't pre-load, but every message I have sent is there, and if I need to send another message saying about the same thing to someone else, I simply call up the old message, and edit the callsign, or slightly edit the text. Oh, and you don't rotate the knob. Most people that have text messaged know it is faster to use the multi-press method on the keypad.

> Just setting a comment line in the 710 is
> painful enough. Messaging is of very limited

I'd have a hard time telling that to the 1 billion people that do it every day for fun!

Everything we do with amateur radio requires training. But hoepefully, everyone knows how to dial a number on a dtmf keypad. That's all APRStt requires.

> APRStt and training APRS-equipped people to
> understand that the people reporting via APRStt
> are not where the map shows them and that they
> can't receive APRS messages etc. etc.

Any APRS software (and there are lots of simplistic clones that don't) should already fully accomplish that. Since 1995, APRS defines 4 levels of position ambiguity and it is required that all APRS software unequivocally display these degrees of ambiguity to the viewer so there is no missrepresentation.

Also, APRS was designed to unequivocally display (by the color of the symbol) which stations had message capability, and which ones do not. In proper APRS displays, a quick glance at a symbol tells you instantly which are message capable. Too bad many simplistic APRS clones omitted this most fundamental principle of APRS.

Finally, APRStt users are message capable when APRStt is finished. Messages are voiced back to DTMF users from the APRStt engine.

> APRStt may be a great temporary idea to accommodate

Agree. Amateur radio has a pretty good supply of outmoded, out dated, operators who will never think outside of the box, nor try anything new. SO it is an uphill battle. APRS is a perfect example. The nay-sayers have been nipping at its heels from day one (1992), and in most cases they are right, yet it has grown steadily as some of the old fuds eventually die out, and some dad's are forced to try new things to keep up with their kids.

To help APRS grow, APRS has always been based not on future dreams, but on what is available -now- to the average radio operator. As each now comes along, we use it and then move in the direction. I have been wanting to take advantage of DTMF which we have had since the 1970's, but until we had a windows version of APRStt, no one would try it. Now hopefully some of them will try it.

See how we use simple 2 and 3 digit numbers on HT's to report Troop scores from the field to eliminate tedious voice reporting for scout events. www.aprs.org/aprsevent.html. Anyone with an HT should be able to do that.

We have got to think outside of the very narrow "APRS tracker" box and start looking at how we can communicate numbers (and text) in our public service support from our HT's.

Before the APRS name was invented, it was called CETS for Connectionless Emergency Traffic System and its first use was reporting 5 digit casualty ID's for the National Disaster Medical Exercise for FEMA. All it takes for TRIAGE at a mass casualty that FEMA is required to support is the 5 digit ID, a 1 digit status, and a few other digits. APRStt is perfect for this.

I appreciate your comments, but surely there are uses in ham radio where EVERYONE with an HT can serve as a possible data entry pint without having to stand in line to make a voice repeort on a very busy voice net.

Hope that helps.

Bob, WB4APR

Is it a laptop with an internal pad, and you are using an external mouse?

If so, disable the internal via the BIOS.

I believe it has to do with Windows thinking that a GPS serial
stream is mouse input during auto-detect, at least that is one of
the problems reported multiple times before. I don't recall the
solution but perhaps a Google search with "mouse gps autodetect"
or similar might yield one.

I've had this problem in the past, too, and it very definitely was Windows interpreting the GPS data coming over the serial port as mouse input.

There's a Microsoft Knowledge Base article about this at:

http://support.microsoft.com/kb/819036

I've used the comdisable tool described in this article. My recollection is that it keeps Windows from seeing the COM port that the GPS is connected to as a mouse, but applications can still read the GPS data.

Bob...

Bob,
Yes I'm in Spotsylvania, Close enough. We should have the coverage down there. if you look at aprs.fi its pretty well covered. They would more than likely need at least one high on site location and it can link right up to the outside world.

If you know some folks that I can do some pre planning with I would be glad to work with them.

As far as the outside perimeter around AP hill its covered. There is one commercial site that would be a perfect fit for getting a signal into and out of AP hill as well as into the neighboring counties. Its a comercial site that isn't interested in ham radio in any way.

    Posted by: "Ford, Steve, WB8IMY" sford@...
    Date: Mon Jun 1, 2009 2:58 pm ((PDT))

Technical papers are solicited for presentation at the 28th Annual ARRL and TAPR Digital Communications Conference to be held September 25-27, 2009 in Chicago, Illinois. These papers will also be published in the Conference Proceedings (you do NOT need to attend the conference to have your paper included in the Proceedings). The submission deadline is July 31, 2009. Please send papers to:

Maty Weinberg
ARRL
225 Main St
Newington, CT 06111

or you can make your submission via e-mail to: maty@arrl.org

Papers will be published exactly as submitted and authors will retain all rights.

>
> Maybe you don't know anyone under the age of 20 that
> is text messaging sun-up to bed-time on their cell phone.

> Text messaging from cell phone key pads has exploded
> an industry worth billions of dollars for youth or anyone
> needing the capabilty.

And text messaging from cell phones only took off once the industry adopted a single standard.

As you suggest, everyon under the age of 30 can easily text without even looking at the keypad -- that is they can do it on a cell phone BUT NOT on their ham radio because in their infinite wisdom the engineers at Kenwood chose NOT to adopt the standard cell phone convention for assigning letters to the numeric keypad. So, anyone who IS expereinced at texting with a cell phone is automatically NOT able to easily enter text on the D710A any more than a QWERTY touch typist can easily type on a Dvorak keyboard.

And, of by the way, that situation gets even worse when you look at APRStt where the documentation shifts back and forth between using the Kenwood style letter assignments and using cell phone standard letter assignments for the keypad.

I have never suggested that messaging is not a good idea, but I have stated quite accurately that the current implementations are seriously lacking in terms of being user friendly.

Monday Afternoon Quarterbacking... Kenwood designed their APRS keypad in 1997 for the D7 HT and back then the "Telephone standard had not yet gelled. There were 3 popular methods but NO single one was the standard. In fact, if you look at a 1998 telephone, Kenwood mathces that standard exactly. And to stay consistent for their users they decided to stick with that same scheme in the year 1999 (a decade ago) when they designed the D700. Still the present cell phone texting did not exist... SO if you want to complain, complain to the telephone company for changing their standard...

> So, anyone who IS expereinced at texting
> with a cell phone is automatically NOT able
> to easily enter text on the D710A any more

I find that hard to believe. The only difference is the Q and Z. Most people can remember the difference. Yes, the D710 did come out in what... 2007, but for consistancy with its decade of other radios, it stuck with the same standard. Hard to fault them for that either...

> And, of by the way, that situation gets even worse
> when you look at APRStt where the documentation

No, we have gone 100% with the current cell phone standard for APRStt. If there are any references to the other system, let me know and I will fix it. APRStt does use the archaic ECHOLINK method for callsigns, however, for very good reason (so all possible callsigns can fit in some limited DTMF memories), but that is only done once per individual and stored in his DTMF memory and will never change. The reset of texting uses the

standard methods.

Perhaps that comparison overstates the problem, but...

> The only difference is the Q and
> Z. Most people can remember the difference.

No, actually the differences are the letters Q, R, S, and Z -- while the Q and Z may not be too common in English language text, the R and the S certainly are quite common. A cellphone texter using the Kenwood keypad would send an R when meaning to send a Q; would send an S when meaning to send an R, would send a 7 when meaning to send an S

http://aprs.org/aprstt.html

As you start to scroll down you will first see the picture DaytonMapHandout1 which uses the cellphone style letter assignments even though it is used to explain the arcane two-key encoding used for callsigns.

Continue scrolling down and you will find picture TT-keys apparetly showing that SPACE-APRStt uses "standard Kenwood (or any DTMF) Keypad key definitions"

John Hansen of Coastal Chip Works produced an adaptor for the D700, and Kenwood inexplicably dropped support for an interface in the 710 model.
It may be possible to produce a version that communicates with the newer radio, but I am surprised that John has not done so. If there is any real interest out there, let me know and I will see if we can pursue a design.

> communicates with the newer radio, but I am
> surprised that John has not done so.

If I can speak for what I know, believe me, John has tried. He has invested a lot of time in trying to figure out the new digital serial streams between the Mic and cnotrol head and radio, but it is very complex and a big obsticle... We even got some info from kenwood, but the problem turns out to be that getting the LETTERS from the PS2 keyboard is still easy, but it was all the special settings to use the PF keys on the MIC to do some of the front panel functions so that ALL messages functions could be done from the PS2 keybopard.

Now you have to go back and forth between the keyboard for the typing, and then to the front panel of the radio for the next step, that is is not as user friendly as John was able to rig up on the D700...

Hope that helps.

6189. Emergency beacons.

Yahoo group: APRS (2007 — 2010)
Date: 2009-06-05 22:48:17 UTC
From: Graeme
Topic: 6189 Message: 6189

Hello all
I was just checking Findu and noticed there was an emergency beacon sent about 21 hours ago in Montreal. Just what is an emergency beacon in APRS, anyhow?

1: Is there any organization monitoring such?

2: Can anyone send one?

3: Why doesn't the sending of such have a special icon so it will stand out from all others? Along with this, why is the ssid still that for a vehicle mounted tracker?

4: Is there a status record of the beacon showing what response occurred?

Any comments?

Graeme

Hi Graeme,
APRS emergency is an add on to Ui-View32 I run it
here in Blenheim

To answer your questions

1/ I don't think any organisation is monitoring its Amateur radio

2/ yes if you have the capability

3/ I haven't seen a Icon so I can't comment

4/ I know that the Ui-View addon has an acknowledgment button

The Ui-View add on is available from here get both and follow the
instructions

http://www.trilogysystem.it/HamRadioe/aprs/software.asp

If you look back in the ZLAPRs List you will see that there has been 1
posted in NZ
but this was manually I responded to it , it was the boating accident up
north 1 SK sorry to say

Graeme

I feel there should be some procedures set up for checking on emergency beacons. Some have said most are false alarms. However, what about the amateur that sends one in a real emergency? It looks like you do not have much of a chance in being rescued!

There are probably several issues with the beacons.

1. With all the law suits being filed for lack of service, I expect if there was a expiation that someone would respond, then when if nobody did, you would have a law suit. Now, with no expiation, there is no issue.

2. To set up a monitoring system, with designated stations to monitor 24/7 would be next to impossible.

a. What do you do when there is a beacon? Do you alert the authorities to check out the location? Do you try and contact the sender of the beacon on voice or other means? Do you try and come up on repeaters in the area to see if anyone know anything about the amateur? Do you try and find a home or cell phone number and contact the amateur or his family? Do you get in your car and try and find him?

b. What do you do about those that sometimes send emergency beacons for hours?

I wish there was a way to respond to beacons. I suspect most APRS users are not aware of how to send a emergency beacon and what type of info to put in for text. Should there be a published way to cancel a beacon if you realize you just sent one by mistake?

Since APRS is worldwide, it would require quite a organization to accomplish the monitoring for beacons in the entire world. You could probably set up something within a country or maybe county. I monitor here using the UI-View Emergency plugin. I've only seen one beacon (I only monitor California, and parts of Navada/New Mexico. I attempted to contact the person who sent the beacon with no luck. Only one or two other stations seemed concerned. I found the operators email, and sent a email. No reply (Don't know if that was good or bad).

6192. APRS tracking signal delay gives late position.

Yahoo group: APRS (2007 — 2010)
Date: 2009-06-06 21:49:54 UTC
From: Paul Lee
Topic: 6192 Message: 6192

Not sure if this was answered but does anyone know why a tracking signal would show up up to two hours late on FINDU.COM through the APRS system. For example my (Mic-E) tracker signal sent two hours before showed the position where the tracker was before with the wrong time. This happens a number of times - sometimes a few minutes late, sometimes more. Usually such signal bounced two or three times from digis. Is it some digis sending the signal out very late???? or what?

6193. APRS devices with display & keyboard interface?

> I feel there should be some procedures set up
> for checking on emergency beacons.

Here is my take on it. APRS is just a tool. It is for supporting communications between individuals or teams or groups, or clubs, or local organizations, or whatever. It is not a public broadcast system. So to answer your question:

There is. ANyone heading out on a trip, or an event, or travel in the wilderness, or taking on risk, or doing anything where he anticipatges he might want to send an emergency message, then it is his responsiblity to inform his "tracking team" what to do when he sends it, based on their understanding of his itinerary, his situation, and his intentions.

Conversly, it is not practical for an indivudal to assume that when he yells FIRE somewhere on the planet with no suplemental informat that he should expect any kind of meaningful and balanced response from the potential 30,000 responders.

ANyway, its a big picture issue... but an individual problem.

Bob, WB4APR

Bob

I suggest you remove the feature from the spec.

That will solve the issue.

rusty

Here is my take on it. APRS is just a tool. It is for supporting communications between individuals or teams or groups, or clubs, or local organizations, or whatever. It is not a public broadcast system. So to answer your question:

There is. ANyone heading out on a trip, or an event, or travel in the wilderness, or taking on risk, or doing anything where he anticipatges he might want to send an emergency message, then it is his responsiblity to inform his "tracking team" what to do when he sends it, based on their understanding of his itinerary, his situation, and his intentions.

Conversly, it is not practical for an indivudal to assume that when he yells FIRE somewhere on the planet with no suplemental informat that he should expect any kind of meaningful and balanced response from the potential 30,000 responders.

ANyway, its a big picture issue... but an individual problem.

Bob, WB4APR

Some have said most are false alarms. However, what about the

From: Craig
Topic: 6189 Message: 6196

I agree with Bob, its just one of many status indicators in the APRS spec and it is a tool for any ham who chooses to use it. If ham radio operator is so clueless that they expect the APRS network to rescue them just because they show their status as an emergency then they need to send their ham license back to the FCC because they are not qualified to have it. This is not CB radio.

Since I mentioned CB radio, Channel 9 is reserved by the FCC for emergencies but anyone with half a brain knows that the FCC is not a rescue service and is not monitoring CB channel 9 in order to rescue you.

Ham radio is NOT a rescue service. Its a communications service.

Taking it out of the spec because the most clueless among us don't know what to do with it is no reason to deny it as a tool for the rest of us.

6197. RE: [APRS] Re: Emergency beacons.

Yahoo group: APRS (2007 — 2010)
Date: 2009-06-08 02:27:57 UTC
From: Rusty Hemenway
Topic: 6189 Message: 6197

This will be my last post on the subject:

I did not say anything about CB or the FCC. I've been in the emergency communications field for over 40 years. ELT's/EPIRBS/ etc get answered (now I'll get slammed for not carrying one of them) .

APRS has a feature built into it that COULD be of great value to any APRS user. With the number of VX8's, D700/710's out there, and amateurs boating, hiking, driving across country, etc, who might become involved in a un-planned emergency, what better way than to activate the emergency beacon on APRS if it's their only working communications system. There are many parts of the country where there is APRS coverage, and cell phones don't work. I suspect that some of us might want to set off the emergency beacon if needed, and hope that someone in the world might pick up the signal.

I guess I'm wrong.

Correct as far as you stated but incomplete. In fact it is very relevant.

The FCC reserved CB channel 9 for emergency traffic; no one polices that assignment but in some areas local first responders (often state police) do monitor channel 9. I have seen signs to that effect along highways. I don't know how effective it is.

The FCC reserved marine VHF channel 16 for emergency and hailing traffic. The USCG polices the assignment in most areas. USCG and local law enforcement as well as commercial towers and all manner of individual commercial and recreational boats monitor channel 16 and respond to emergencies.

Amateur radio, as a self-regulating service, need not depend on the FCC to identify emergency communication mechanisms. Specification of an APRS emergency beacon does not carry an obligation by WB4APR or anyone else to monitor or respond. A local organization (ham club, ARES, RACES, SAR organization) could voluntarily incorporate monitoring into their operations if they so chose. It could be pretty cool to filter APRS-IS by region and/or monitor RF and trigger notifications by both ham radio and other links to responders but again no one is obligated to perform simply because the capability is specified.

From: kd5pck
Topic: 6199 Message: 6199

Has anyone used any of the TinyTrak units? I would like to know if it would be useful for what I plan to do.
I would like to make a portable package that could be self-contained except for the external antenna. I want to have the capability of tracking support units involved in a 150 mile bicycle ride. Each unit would only have to transmit its location, not receive other stations locations. This would be monitored on a laptop by a net control using an APRS program. I have a couple of Kenwod radios that I'm not using. Would the TinyTrak be compatible with the D700 and thd7a(g)? Anyone have any comments on the TinyTrak units?
Thanks,
Scott

Scott,

If you have the D700 and D7 you already have the APRS capabilities. All you need to add is a GPS to the radios and you are on the air. TinyTrak units are for radios that do not have a build in APRS type TNC's.

Take a look at my 2 meter BeeLine GPS.

http://bigredbee.com/blgps_2mhp.htm

Single board.
No cables.
Self contained.
Smallest solution available.

Or the "original" high powered, self contained tracker, the Micro-Trak AIO from Byonics, which is twice as powerful for less money. http://byonics.com/microtrak/mtaio.php

6203. AIO vs Big Red Bee

Yahoo group: APRS (2007 — 2010)
Date: 2009-06-09 22:59:51 UTC
From: CaptALord
Topic: 6203 Message: 6203

I received an E-mail calling me on whether the AIO was the first all-in-one tracker around. To be fair, Greg of Big Red Bee had the first fully integrated tracker, sold as a PC board level product. Tony Barrett of Hi-Value radio made the Pocket Tracker, also provided as a board level product, but without an integral GPS. (long extinct) Our definition of an all-in-one product encompassed a product with a fully self-contained and packaged APRS tracking transmitter, TNC, batteries, and antenna, etc, ready to operate by throwing switch. I meant absolutely no disrespect to the fine products made by Big Red Bee. Another example of what we would call an "integrated" tracker is the Rtrak, from Jason of RPC Electronics, although its power output is only about 500 Milliwatts.

Also, I should point out that the Big Red Bee includes a programming cable, whereas we don't, since the vast majority of our purchasers simply opt to take advantage of our free programming. (Byonics sells the Kenwood Style cable for 15.00) Gregs' unit is smaller that ours, and weighs less. The BRB has a 5 Watt output max, and ours has a 10 Watt output max (adjustable in both products I believe) We offer a choice of 3db rubber whip or magnet mount antenna in the 250.00 unit price, which includes programming, but not shipping. The products are alike in more ways than they are different. We use power control circuitry to awaken the GPS before a transmission, wait for it to lock, and then send a transmission, giving the unit a life of about 8 Days with an 8 Pack of AA batteries, at 10 Watts (Diminishing with battery voltage of course) Both products will do Smart Beaconing, although we have to turn off our power saving mode when we use this mode. I don't know what the operational time of a BRB unit is on a set of batteries, Greg can comment on that. Both units have voltage regulators allowing direct vehicle power, and SMA RF connectors. The BRB unit sells for 275.00, including programming cable.

From: k7rkt
Topic: 6203 Message: 6204

Thanks Allen! That's a very good comparison, next time anyone has questions about the BigRedBee stuff, I'll send them your way ;) hi hi.

As Allen says, feature wise, the AIO and the BRB are very similar. The BRB actually tops out around 6 watts, but I find it easier to quote 5. The BRB also has the ability to powerdown the GPS module and wake it back up to save power, I haven't actually measured how long the batteries would last, but I'd suspect similar results.

The BRB has an on-board non-volatlile memory to store waypoints at a user definable interval -- up to 1300 positions can be stored, read back, and displayed via Google Earth.

The biggest difference between the two units is size. The BRB was originally designed for use in high power rocketry. The circuit board is only 33mm x 90mm, and can operate off of a single cell lithium poly battery and generate 1 watt out. Full power can be obtained with a two cell Li-Poly battery running at 7.5V, or just 6xAA batteries.

As it was originally designed for rockets, there is also an option to use a special GPS chipset which will function properly above 18,000 meters (the SirfIII does not). This chipset also supports correct capture of rapidly changing altitudes present in rocket and balloon flights which the SirfIII does not.

The current package price does not include the antenna. I always believed that antennas are such a personal choice, that I chose to leave them off.

The good news is that there are lots of choices available for you. Pick the one that meets your needs. Better yet, by one of each!!!

We did just that using TT4's and UIview and 3 digipeaters to ensure coverage we even had it set up to display at the command center tracking 9 sags and a couple of support vehicles it was estimated that it cut the traffic on the phone network by 50-75% The set up I used was a TT4 and as RS 2 meter rig plugged into a power adapter in the van.

Subject: [APRS] TinyTrak

Has anyone used any of the TinyTrak units? I would like to know if it would be useful for what I plan to do.
I would like to make a portable package that could be self-contained except for the external antenna. I want to have the capability of tracking support units involved in a 150 mile bicycle ride. Each unit would only have to transmit its location, not receive other stations locations. This would be monitored on a laptop by a net control using an APRS program. I have a couple of Kenwod radios that I'm not using. Would the TinyTrak be compatible with the D700 and thd7a(g)? Anyone have any comments on the TinyTrak units?
Thanks,
Scott

To all,
Thanks for the great information. I have bookmarked all the links to check out more indepth later. I may have a use for some of the AIO units. The only drawback is the limited power of these. I'm not familiar with the APRS coverage along the route which is being used. I don't know if there is a digipeater along the route. Net control will be the highest point along the 75 mile route. Simplex comms. can be received. I just would rather use the radios in case more than 5-6 watts is needed.
But already having the radios, I guess I'm looking for just a GPS receiver. Not necessarily a GPS unit. I need something that can receive the GPS info and send it to the radios to be beaconed. Anyone have any ideas? Plug and play would be ideal. But I can make a cable if needed. Cheap is good too.
Thanks for the help.
Scott

We were actually the first one to market with a true All-In-One Tracker, that is Modem + GPS + Transmitter in a single box. We had a working demo at Dayton three years ago. The real difference was, we did not have a version with internal batteries such as the MicroTrak AIO and the BRB.

I have a version with internal batteries that has been in my virtual "design bin" since about six months after the original RTrak was released. I just have not found much time to dedicate to getting it finished. In those regards, Allen beat me to market with a battery version :o)

I am going a little backwards and working on a tracker + GPS combo meant for interfacing to a radio of the user's choice. This allows them to have a receiver (if wanted) and as much power as they want to use. The biggest complaints I hear are "No receiver" and "Not enough power". Although, performance reports continue to astound me. One guy tells me that his digi a mile a away can't hear him, another tells me he drove across the southwest and only went the longest of 10 minutes without being heard!

Jason,

Again, I would use the nomenclature "integrated" to describe a tracker with all the guts in one box, and save "all-in-one" for stand-alone trackers with self-contained batteries. Scott at Argent of course now has his transceiver "all-in-one" in a Pelican style box (I think its still in Beta) so now we will have to deal with what we call an all-in-one transceiver with an internal GPS, but no integrated GPS display...I called my version in that format a stand-alone digipeater, but it tracks too. I think you are right about having the first packaged unit with a GPS on board.

Of course, Garmin and Uniden beat us all to the punch with the RINO and the Mystic. (FRS and Marine bands dam them!) Garmin shows no interest in doing a ham band RINO, so eventually one of us will have to summon up the R&D money to make it happen! (Any wealthy Hams out there care to send us a boat-load of venture capital?)

I saw an app for the iPhone that may be what you are looking for. I have not used it so I cannot give you a review. Most apps for the iPhone have a version for Blackberry phones as well. It's called "iBCNU". It sells for $1.99 thru iTunes. Their website is www.ibcnu.us.
Hope this helps.

6215. MFJ 1270c, Garmin 176c, and APRS+SA

Yahoo group: APRS (2007 — 2010)
Date: 2009-06-18 02:02:15 UTC
From: phantom_sniper8541
Topic: 6215 Message: 6215

I have a question and need some help. After several days and much research I finnaly got APRS running on my Vista64 controlled laptop. I'm using APRS+SA....I never could get UI View 32 to work AT ALL.....I have an MFJ 1270c TNC-2 and a Garmin 176c. I was wondering how to get them to work together without the laptop for a (temporary) mobile application. What are the commands I need to set up in the TNC. The manual was some what helpful but not complete. I got a lot of information from the internet and local Hams. Unfortunatly they all use Kantronics and not MFJ. Things like the NMEABCN command wasn't even in mentioned in the manual. I found a referance to it on the internet and then looked for it in the DISPLAY command.

Any information or guidance would be appreciated.

Thanks
Doug KJ4INB

6216. GPS Navigation

Topic: 6216 Message: 6216

Hello, I am new to APRS and GPS systems, I don't know much about them. I want to get a navigation system for my Dual Purpose motorbike, mostly for off roading. Does anyone know if most navigations systems have a port that you can plug in an aprs unit. I know most handheld units work but what about a car type navigation units? I don't own any GPS or APRS equipment so like I said I don't know much yet. Maybe I should just go buy one and play around with it, i'm sure that would help answer some questions. I am just assuming you can run the GPS mapping and aprs at the same time. Maybe it's just easier to buy a handheld unit.

Thanks

From: k7ybz
Topic: 6216 Message: 6217

There is no simple answer to your question. Yes there are GPS units that can output position data for APRS. However, that data can be proprietary or the NMEA standard depending on the manufacturer of the GPS unit. Many of the TNCs only take NMEA input so a translator will be needed for the proprietary to NMEA conversion.

If you are going off-roading, then you want a GPS unit built specifically for a motorcycle or at least hiking. They are more rugged and waterproof whereas the car type units are not.

There are handheld radios available that have a built in TNC for APRS and only need the NMEA data input. Some of which are waterproof. Otherwise you will need a TNC that can take in either the proprietary data or NMEA data and interface that TNC with a radio.

In a nutshell, there are many possibilites for a setup but you will have to research which will work best for you. There are lots of web sites devoted to APRS besides this group.

As a suggestion, check out tracker2@yahoogroups.com and www.argentdata.com. The OpenTracker2 TNC can work with the Garmin proprietary data and NMEA. Scott also has a GTRANS cable for converting Garmin proprietary data to NMEA.

There are smaller "car and marine" GPS navigation units which will let you do this, i.e. use the unit for turn-to-turn street navigation _and_ communicate with APRS equipment.

We use a Garmin GPSMAP 276C for that purpose; I think it should have a size also useful for a motorcycle, as long as you get a suitable mount.

Most car navigation units do not communicate through a serial port, only through a USB port (which normally wion't let it speak with a TNC or an APRS radio transciever like the Kenwood D7*s

Most likely they are running the digi to help themselves when using an HT or other low signal path locally and the iGate as a service. In some instances they may be the only APRS user in the area willing to spare the effort to provide either.

IGates are the connection between RF and the Internet (APRS-IS) while Digis are the connection between RF and RF. Lots of locations don't have access to the internet so they usually run Digis only. The Digi helps move the packet along an RF path depending on how many hops are in the users path. WIDE2-2 for an example would go through two Digis and then stop being moved along the RF path. If your packet hits more than one IGate along it's path only the first packet to make it to the APRS-IS shows up. So if you used a long path like WIDE3-3 and all three Digis the packet bounced through had IGates with them all three IGates would report the packet to the APRS-IS as well as RF but duplicate checking in the APRS-IS would make sure (most of the time :-)) that only one of the three would make it into the APRS-IS.

Running a Digi in a area where there is already a Digi can result in lots of extra packets being broadcast on a frequency that can't handle a lot of traffic in the first place so local coordination is essential. Likewise running an IGate in an area where there is already an IGate can result in extra packets being generated into and out of the APRS-IS. While extra packets into the APRS-IS isn't a big deal duplicating extra packets from the APRS-IS back out into the RF is a issue. Most IGate software can be set up either to send only, receive only, or send and receive. APRS Icons don't show you how the IGate is setup only that it is an IGate. In my humble opinion you can't have two many receive only IGates in an area because all duplicates heading into the APRS-IS get removed anyway.

On final thought; Sometimes you'll see two Icons at a location, one for RF and one for the IGate, while other times you'll only see one icon to represent both. That's just because of the way the operator setup the combo Digi and IGate. Hope that helps answers your question.

My confusion is why would you operate a Digi to repeat packets and an Igate to absorb packets at the same location?

This seems counter productive to me in terms of spectral efficiency.

I am not saying it is wrong. I just don't understand why it is done.

Kim,

Some areas need the RF side to act as a fill-in or even high-level digi, so that users in the local area are served, allowing those of us with mobile monitoring capabilities (for instance) to see the position or messages of local units without having to have access to the Internet. Most I-Gates don't send much data back out through the RF side of things, so RF spectral efficiency is nearly unaffected. There is, I suppose, some danger of having so many I-Gates in an area that the Internet side of things gets overwhelmed, but I don't think that is much of a problem. Another very compelling reason to have an I-gate/digi is when you are operating on a frequency other than the National APRS standard frequency, as is often done with special events, to avoid overtaxing the RF side of the main network, but still allowing the Internet side to distribute the information for command and control.

What I tried to convey earlier is that someone who runs a digi,
WIDE1-1 or WIDE-area, to enhance local RF path may also run an iGate
to propagate to APRS-IS simply because the next closest iGate may be
3+ hops away. He/she is simply provided both services. If one's
packets never hit an iGate, services such as aprs.fi or fundu.com
don't know you are there.

I have ben into areas that have a small RF digi but insufficient range
to touch an iGate. Someone with a broadband connection and the will to
provide the service are an asset.

APRS is more than just an internet gateway. There are local users dependent
on receiving local information via RF only.

Just enjjoy APRS and show it to all your club.
Send a CQ FD CQ FD message to CQSRVR once an hour or so and that
way you will get the same kind of CQ messages from everyone else
in the world, and can make lots of contacts. They wont count
for FD, but for a demo, it is great!

Well, one reason might be that some places a RFONLY of NOIP in the
address in order to prevent packets from getting to the Internet.
Another might be that weak stations can get a stronger signal out from
the digi and therefore reach another RF only station, e.g. a car (or
another car). A mobile operator couldn't make any use of a packet
which only is distributed via the Internet.

Because APRS is not about the internet. The Internet is a nice overlay and global observer of APRS activiy and the backbone for messaging out of area, but the primary value of APRS has always been about letting mobiles SEE the surrounding ham radio activity as reflected by the local area digipeaters.

Hence, digipeaters provide the 2-way all-to-all connectivity that make the system work locally.

The above question reflects the limited view of APRS as a vehicle Tracking system only. It is not. Please see missconceptions about APRS on
www.aprs.org/APRS-tactical.html

Date: 2009-06-23 20:06:43 UTC
From: David - KG4ZLB
Topic: 6236 Message: 6241

I have looked through everything I can find try and answer my question
so I am hoping that someone can help regarding packet paths!

I am using a Kenwood TM-D710A and I am trying to set one of PM's for ISS
and PCSAT APRS; can I have the packet path string showing all of the paths?

For instance, it seems that the ISS path changes from RS0ISS-3 to
RS0ISS-4 (the only way to tell which it is is buy watching the screen to
see how someone else's packet has been digipeated) and PCSAT seems to
have at least 2 digi addresses.

So I have at the moment the following packet path:

RS0ISS-3,RS0ISS-4, ARISS,SGATE,WIDE2-2,W3ADO-1,PCSAT-1,WIDE

which should cover any changes in the ISS plus PCSAT. As they are both
on 145.825 it would be nice to kill two birds with one stone, so to speak!

Is this correct? Is this overkill? Will it work?

Thanks in advance for any help or advice!

73

David

6242. Garmin Nuvi 265WT + Kenwood D710

Yahoo group: APRS (2007 — 2010)
Date: 2009-06-23 23:07:56 UTC
From: kb6nyu
Topic: 6242 Message: 6242

I know this subject comes up a lot, but I haven't seen anything specific to this hardware, so I'm looking to others here who may have some specific knowledge.

I recently acquired a Garmin Nuvi 265WT, with the intention of getting a Kenwood D710 to complete a mobile-chase-vehicle APRS tracking system. I'm using a Byonics AIO on the tracked object (balloon or glider).

I got the Garmin Nuvi 265WT because it's compatible with Garmin's new FMI cable that also has an integrated FM-Traffic Receiver. I want to use FM traffic for everyday use. I don't think I'll need FM-Traffic with APRS simultaneously (not much traffic in the desert in the APRS chase scenarios that I can anticipate.

My real question is: Can the above setup provide a tactical display of my single Byonics AIO? I know filtering can be accomplished on the D710 side, and the AvMap + Kenwood D710 makes for a good tactical mode (I've seen W6GPS's video). Has anyone done this with the particular Garmin Nuvi 265WT + Kenwood D710 setup?

Thanks

-mark

I'm researching the same. I have a Nuvi 265WT, but was thinking of using a laptop as my tactical display.

I have one of those compact laptops (Acer Aspire One), which cost about the same as a Nuvi 265WT (got both at Costco).

Is there a NMEA output from the D710? If so, that would provide a way to provide a tactical display on the Acer netbook.

I found the attached doc while Googling with "d710 avmap". The configs appear to set the D710's TNC output as the APRS data output (serial, 9600).

Does anybody have a pinout diagram for D710's TNC plug? With the right cable, it might be possible to get the serial data that is output and displayed on at least a laptop.

Also found the following (apparently using UIView on a PC with D710).

1. Kenwood TM-D710 with embedded APRS
Posted by: "g8zqa" peter.stonebridge@... g8zqa
Date: Sat Dec 22, 2007 6:31 am ((PST))

May be slightly off topic, if so I will willingly delete message.
Have at last managed to set up my Kenwood D710, (I think), and am
happily decoding signals on the UiView maps. My weather station is
certainly putting data on my screen, hopefully it is escaping to the
outside world!
However, every time an APRS signal was decoded, the receiver beeped. I
managed to turn the beep off in the menu, but discovered that this was
a "key operated" beep only, but at least I turned it down in volume.
It took me a long time to discover that the remaining beep could be
turned off completely in menu 624, "RX Beep"! Thanks to all those who
offered advice and a Happy Christmas to all.

All of the Garmin Nuvi's output Garmin binary, not NMEA. In order to interface with the D710 you will need a Garmin binary to NMEA translater. Argent Data has such a beast specifically for the D710, called a GTRANS cable.

The D710 users manual has the pinout for the PC interface from the TNC.

I have the D710 and have used the GTRANS cable with a Nuvi 350 and it works just fine. I also have the AVMAP for the D710 too, which is ideal, that is after dealing with some initial issues with the AvMap.

Note that if you use the FMI with a TNC that talks Garmin, you will have breadcrumbs for tracking. Not sure if you want that for event use. The Nuvi 350 is the only unit that does not leave breadcrumbs when in FMI mode.

Also, the nuvi 2x5 series takes a different cable that I haven't had a
chance to analyze yet. I *think* the only difference is that it's got a
single USB mini-B cable for both power and data. That means it needs a
5v regulator in the cigarette lighter plug.

I designed the GTRANS board with that possibility in mind, so there's an
extra pad on the serial side where it'll take 5v in. You could easily
scrap a cell phone charger or something that puts out enough current
(probably at least 500 mA) and wire it in.

That'd get you NMEA from the nuvi, but as far as I know the 2x5 series
won't plot waypoints at all. Not yet, anyway. There's a possibility
that Garmin will change that (lots of people have been asking) but I
can't say when that might happen or what models any updates would apply to.

Thanks Ceasar, I'd hoped to avoid a PC-based solution this time. I've had a mobile-PC system in a previous vehicle for several years. I got the Nuvi for a new vehicle with the hopes of a much cleaner setup. The Acer Aspire One running APRSPoint would be a good alternative if I'm not sucessfull with the Nuvi.

If it was point to point and didn't go through the internet or through a repeater - and you passed a FD exchange through it... yes. But I think you'd spend more time figuring out whether it was truly all those things.

As long as you don't use a repeater (standard or internet) - and that is pretty rare for APRS... If you were out in the boonies and couldn't work a digitpeater or an APRS/internet Igateway - then it would be a direct contact and it would count - but you would need to exchange the Field Day information of section and class - 9A KS - for instance. And confirm the contact. That would mean using the message capability of APRS.

How do you make a contact on APRS? Just log the stations you are
seeing direct? Via Message? Inquiring minds want to know.

Hmm, I don't see any replies to this, so:

I doubt it will work, most packet stations ONLY work on the first
unused call, so in your example, unless RS0ISS-3 is on the air, your
packet will never digi.

For ISS, it's safe to just use ARISS, after ISS digipeats it, it will
convert the ARISS in your path to RS0ISS-3 or -4 (what ever is
currently configured)

For PCSAT, using PCSAT is perfered, but it's batteries are dead, and
it can't maintain it's config, so it keep reverting to W3ADO-1

They ask that you don't use W3ADO-1 in your path, unless you are
physically present at the time, and it's not automated at all, cause
since this is the default call, it's what they use to restore it, and
the last several times, too many people kept using this call, and
caused the satellite to be non-restored and go dead again.

Patrick,

Many thanks for your help, that explains things really well as I was getting a bit lost.

I will make the changes you have suggested and see how we go.

I have always used a PC/AGWPE and UISS to digipeat through the ISS, now I have bought the TM-710A so its a lot different.

I have never managed anything at all with PCSAT (NO-44), I hear it often but it never seems to complete a full packet burst.

I will set one of the memories on the radio for ARISS only for ISS and just review the PCSAT situation.

Many thanks again!

Most packet stations only work on the first call but this is APRS. APRS uses UI or Unumbered Information packets to transfer data. (Much like UDP on the internet) So you can put almost any call in as the first call and it should work....in thereoy. In reality digis can be set to only digi certain calls and not others. What that means is that all stations will hear your UI packet if they can hear your station directly no matter what call sign you insert but what and how far you packet goes can depend on what call sign you use and yes the order (if you need to use more than one) is important.

I made a trip through the ARISS a few years back and did so by looking at the order of call signs on packets that eventually made it all the way through to the internet. Can't recall what call signs(s) I used but I do remember studying what made it through was the key to my success.

Hmm, I don't see any replies to this, so:

I doubt it will work, most packet stations ONLY work on the first
unused call, so in your example, unless RS0ISS-3 is on the air, your
packet will never digi.

For ISS, it's safe to just use ARISS, after ISS digipeats it, it will
convert the ARISS in your path to RS0ISS-3 or -4 (what ever is
currently configured)

For PCSAT, using PCSAT is perfered, but it's batteries are dead, and
it can't maintain it's config, so it keep reverting

Ya, generally these days, just using the satellite call is enough, as
there are people downlinking satellite to internet.

If not, then you have to hope someone is relaying from the satellite
to 2m aprs, then you would use the SGATE after the satellite name in
the path, and possible WIDE1-1 or WIDE2-2 after that to make it to an
IGATE. But I haven't needed this on my on transmissions over the last
year or so.

Now what you can do is set it up for like, ARISS,PCSAT
and if they are within range of each other, you can hope for a double hop.

I know many people have the power issue with pcsat, that it dies
halfway though a packet. I haven't had much problems getting a digi
through even in those conditions, if I use no comment, and use
compressed packet format, and a really short path (normally only
W3ADO-1, since it's lower power it resets all the time, but make sure
bob hasn't requested silence, normally posted to the amsat list).

This isn't hard to do, just don't connect to the internet, and use an
empty path setting. Then all you have to verify is that when people
reply to do, they don't have any *'s in their path, or just confirm
they used an empty path back to you.

Now that I said that, lets counterdict myself.

You can use a path of TEMP, I guess TEMP7-7, or can it go higher?
Using TEMP digipeaters are OK for fieldday, as they where setup for
fieldday usage and aren't fixed mounted systems.

hmm, can't find a more current webpage

Can't go higher than 7-7 as the AX.25 packet header is limited to that
many hops. At least, that's my understanding and interpretation.

Nope. You're thinking of the AX.25 spec that has an upper limit on
the number of digipeater slots, but the WIDEn-N stuff that APRS does
only takes up one of those slots. You could technically do
TEMP15-15 if all the firmware could handle that many hops. It's not
an AX.25 spec limitation in this case. Fun eh?

Yes, you can START with TEMP15-15, but as the digi's start filling in
their IDs (as all good WIDEn-N digis are supposed to do), you'll run
into the AX.25 limit when you've still got TEMP15-8 left. APRS is still
transported over AX.25 UI packets and the (original and accumulated)
path is most definitely subject to all of the AX.25 standards. That's
the source of the 15 limit on the SSIDs as well.

Depends on how the digi's are set up, but yes, I get your point
here. There have been times in the past when the digi's all show up
in the path one by one as they use up a slot, and there have been
times when only the last-used digi gets filled in.

I believe it's all set up to be traceable now, which is the former
condition, so your point applies to the current situation. I should
have thought of that too!

If it were set up like the latter still, then 15-15 would
potentially work. All theoretical anyway since I think all the
firmware would choke on anything above 7 anyway. Also: The chance
of getting a packet through 7 digi's in a row is pretty low, 15 is
astronomically low. Again, theoretical discussion. But fun anyway!

Call for Papers--2009 ARRL/TAPR Digital Communications Conference
    Posted by: "Ford, Steve, WB8IMY" sford@... wb8imy
    Date: Fri Jun 26, 2009 6:41 am ((PDT))

Technical papers are solicited for presentation at the 28th Annual ARRL and TAPR Digital Communications Conference to be held September 25-27, 2009 in Chicago, Illinois. These papers will also be published in the Conference Proceedings (you do NOT need to attend the conference to have your paper included in the Proceedings). The submission deadline is July 31, 2009. Please send papers to:

Maty Weinberg
ARRL
225 Main St
Newington, CT 06111

or you can make your submission via e-mail to: maty@...

Papers will be published exactly as submitted and authors will retain all rights.

Bruce,

Welcome back! As usual, where you live will determine the specific paths you should use, but a good start at this point is WIDE1-1,WIDE2-2 OR WIDE1-1,WIDE2-1. Some will argue the first one is a bit much, but again, it depends where you live.

In the last two months, I went from living in a major city to a very remote country town. When I was in the city, the second path was plenty, now that I am living "in the sticks" the first path is more suited. I just need to get that extra hop to get anywhere.

Your best bet is to give one of those a try and then do your best to get up with local APRS users and check it by them. See what they are using. When it comes down to it, these paths are all depending on the settings of the digipeaters in your area. If the digi is setup to recognize these types of path ie. the WIDEn-n paths, then you should be in good shape.

SOME areas are behind the times the digipeaters have not be updated, so you find users still using paths like WIDE,WIDE and RELAY,WIDE.

Good luck!

I just last week did a statistical look at the USA APRS density map and of the 25,000 stations, more than 80% of them live within 100 miles of the major metro areas and the other 80%. No more than 2 hops should be used by any of those 80%. You can see the map density page on www.aprs.org about 45% down the page.

It is better to simply suggest WIDE2-2 or WIDE1-1,WIDE2-1 to all newcomers rather than leaving it up to them to figure out when not to use 3 hops.

Though, I do notice that those people out in the boonies do tend to use HAM RADIO more than those in the metro areas. I love driving through tennessee for example, because there are ALWAYS qso's on VHF and nets most nites showing lots of aciviy.

Hi All:

I've recently set up an i-Gate (soon to be a digipeter to fill in a minor hole where I am) - and would like to add weather data to it.

I'm not looking to re-create the National Weather Service - so I'm not looking to put huge $ into it.

So....is it possible to use the LaCrosse Technologies WX station? What software - can their software output properly for APRS?

Thanks in advance for your advice.

What model station? Does it have any kind of interface, preferably serial? A lot of stations output the standard Peet/Ultimeter format that is supported by most APRS software and trackers like the OpenTracker and Tracker2.

The model number will help us determine if it will work.

The Tracker2 will work with the LaCrosse WS-2300 series stations - at least, a few models have been tested. The hookup is a little unusual, but it works. No need to tie it to a PC.

Beyond the fact that the scale makes the map nearly useless unless you happen to live in the center of one of the red dots, that entire map is rather misleading when it implies that there is essentially continuous APRS coverage throughout the eastern half of the US.

At best, the data in the so-called "APRS User Density" map is four years out of date (February 2005).

I won't even try to guess what method was used to generate these "statistics" but I will openly laugh at anything that says I live in an area where the APRS density is at least "45 per degree" or that there is an area just south of me where the density jumps to "13 per degree" -- Ordinarily I might believe the counts for Atlanta GA, Cincinnati/Dayton OH, or the Washington DC-Boston MA corridor; but considering that I KNOW the green and blue areas shown in Kentucky are grossly inflated, it becomes hard to put much faith in the rest of the map generated by the same source.

More timely and much more useful information is plotted in the map at http://www.aprs.org/photos/USA-6day.JPG

An even better view would be the map at http://wa8lmf.net/APRSmaps/NorthAmericaLarge.htm but unfortunately it is undated and appears out of date.

However for an interesting comparison, look at the enlarged map at http://wa8lmf.net/APRSmaps/NorthAmericaLarge.htm and compare it with the impression you would get from the single screen version of the same map at http://wa8lmf.net/APRSmaps/NorthAmericaSmall.htm

There certainly are some areas of the US where the APRS user density is high, and spectrum congestion is a problem -- but a four year old map suggesting that this is true of the entire eastern half of the US is simply a farce.

Topic: 6271 Message: 6276

For a daily view of ARPS traffic in North America, check out:

http://ldeffenb.dnsalias.net.nyud.net/Tracking/MC24/* (trailing * required).

Scroll to the very end of the list for the current whole-USA view.
There's also Central Florida, Florida, and SE USA views in alpha/date order.

These are midnight-to-midnight Eastern time accumulations with each dot
representing a position report. They are generated automatically each
day just after midnight Eastern.

Lynn (D) - KJ4ERJ

PS. Please be patient with the slowness and zoom in if you want to see
more detail. The map resolution is quite high.

PPS. If you'd like a zoom-in daily view of any particular area's APRS
activity, just e-mail me the lat/lon rectangle you'd like covered and a
name to give the resulting map. I'll add it to my daily list and it
will be available at this same URL.

Hi Tom,
I have used the lacrosse in the past, The 2300 is a good unit. they have a 2300 working group for stand alone programs that work great.

My setup is a little unique. I currently use the Dallas one wire. but it is tied to a system that monitors my solar and wind energy. I pull the data off from a serial connection to my computer. I'm running ubuntu Linux and Xastir. This computer is a websever for my solar energy system as well as an Igate and a weather station for the local APRS network.

I wrote a short set of scripts to compile the senatence stream and send out my weather over the air locally and to the internet servers. it all runs as cron jobs.

I have a LaCrosse 2310 and use Weather Display software.

http://www.weather-display.com/index.php

It will upload your weather data to the APRS sites and works for many
different
models of weather stations. It also includes a Web Server.

I think I paid $75 for the software but it is very good.

Hi Group,

I ahve a Kenwood TM-D710A connected to a AVMAP G5.

I recently took a trip of several days and several friend sent me messaged. the meesages are not being received in my mobile.

When I returned home the messages were on my TH-D7 witch I use at
home to transmit my home position.

On a second trip I tried again to send messages and they did not arrive at either lccation.

Messages were sent using http://www.findu.com/cgi-bin/entermsg.cgi.

Messages appear as being sent. But are not being received on my radios.
Call configured in my home location: AD4UU. Call configured in my mobille is: AD4UU-1.

Any help would be greatly appreciated.

Thank you

Dave/AD4UU

Thanks for your response, Lynn,

Your map
http://ldeffenb.dnsalias.net.nyud.net/Tracking/MC24/MC-USA-2009-06-28T00.00.00-2009-06-28T24.00.00.png
bears a strong resemblance to the map I cited at
http://www.aprs.org/photos/USA-6day.JPG and agrees with my own informal
experience and observation that the letters A P R S do not occur in the word
KENTUCKY

As for a custom map, perhaps something covering about Paoli Indiana
(Latitude = 38.5546, Longitude = -86.4651) at the northwest to about London
Kentucky (Latitude = 37.1253, Longitude = -84.0894) at the southeast, and
named KYANA would be interesting.

From: Tom Ray
Topic: 6278 Message: 6282

Thanks for the great answers.

I'm running UI-View32 on a dedicated PC. Prefferably, something that will output the proper data format which I could put into a com port on the computer. UI-View just needs the proper data format - but will not recognize a particular make or model of WX station.

> For instance, it seems that the ISS path
> changes from RS0ISS-3 to RS0ISS-4...
> So I have at the moment the following packet path:
> RS0ISS-3,RS0ISS-4, ARISS,SGATE,WIDE2-2,W3ADO-1,PCSAT-1,WIDE

It does not work that way. The header for AX.25 usually looks
like this:
FROMCALL>TOCALL,DIGI1,DIGI2,DIGI..3 etc

This is usually implemented in the UNPROTO command of yoru TNC
as
UNPROTO TOCALL VIA DIGI1,DIGI2,DIGI..3 etc

FROMCALL is obviously your station
TOCALL for APRS is generic such as APRS or APxxx where xxx
represents what kind of software or systm you are using.

But the DIGI's are where the PATH really works. They are taken
ONLY IN SEQUENCE, one at a time. SO your path will only go via
ARISS then it will look for an SGATE and then it will look for
WIDE2-2 and so on. Anything after the next digi is ignored
until the earlier paht is all used up.

The best path is simply via ARISS and the ISS radio will
digipeat it independent of what its callsign is, because it
recongizes th eARISS alias..

You cut across one small corner of the state and observed "lots" of travelers passing through on the same short stretch of interstate? Or observed "lots" of non-Kentucky stations relayed through non-Kentucky digis that you could pick up on an interstate that never gets far from the state line??

not to bad mouth a product, just a beware..

Watch out, weather display is a memory hog. Just like most windows programs it leaks. I used it in the begining and try to use it a while back. it causes crashes. Thats how I was turned on to the 2300 working group and the small tools that they had worked soo much better.

6287. Some help with APRS.FI

Yahoo group: APRS (2007 — 2010)
Date: 2009-06-30 23:16:04 UTC
From: Phillip
Topic: 6287 Message: 6287

Hi,
I have seen many people ask question about aprs.fi and its uses.

I hope this info below helps the new comer to APRS and the understanding of how aprs.fi works, I am sure that
there may be more features that I haven't mentioned but this is a start.

I have used KE6O-15 as a reference only, substitute this call with any known digi call

http://aprs.fi/?call=KE6O-15&mt=m&z=10&timerange=3600

http://aprs.fi/heard/KE6O-15 every station heard by KE6O-15

http://aprs.fi/gated/KE6O-15 every station gated by KE6O-15

On the left side of the aprs.fi page are some Icons

Pointer with a bar --->| widens screen shot

House with antenna takes you home

Red and Blue circle is coverage area (PHG) Power, Height,Gain

You can manually change the items in the PHG to reflect the correct coverage by doing some tests with a known good mobile
of about 5 to 10 watts , this may mean you have to decrease the Height or the antenna gain etc ..

http://aprs.fi/?call=zl2ks-3&mt=m&z=11&timerange=3600

If you look at our digi ZL2KS-3 this PHG has been tested on a regular basis by a known good set up ZL2BK-9 who travels this
section of road up to 3 to 4 times a month. Cover age was checked with 1 watt and 5 watts

PHG calculators
http://www.apritch.myby.co.uk/phgrcalc.htm
http://www.nashvilleaprs.net/apps/phgcalc.php

PHG should only be used by Digi's or Igates that also digi .. Please don't set PHG in your Mobile

1 click = Blue = "rough" mobile coverage 2snd click =Red is for Hill top Digi "rough" coverage

A is the ruler to active click the A then move to a section on map click once wait for the Balloon to appear then drag
the balloons to the location you wish to measure.

To close all the above just click the Icon or in the case of the rulers click on 1 and it will ask in blue [delete ruler] click on that

There is also " Other Views "

Station info
Raw packets
Status packets - Beacon packets
Messages - Bulletin board
Prefix browsing
Google Earth KML [?]
Preferences

Remember to set your Preferences

The above should help many who want to know what features are available for sorting out coverage problems, tracker problems etc.

Enjoy the service of APRS.FI, its a great tool, someone close, send that man a beer ..

Topic: 6287 Message: 6288

If you put in my mobile APRS call (N1CKM-2) you will find me somewhere outside of Pittsburgh. Not sure how that is possible. I haven't been in that area in 3-4 years. Anybody have an ideas?

N1CKM

presently using APRS in Columbia SC area.

Subject: [APRS] Some help with APRS.FI

Hi,
I have seen many people ask question about aprs.fi and its uses.

I hope this info below helps the new comer to APRS and the understanding of how aprs.fi works, I am sure that
there may be more features that I haven't mentioned but this is a start.

I have used KE6O-15 as a reference only, substitute this call with any known digi call

http://aprs.fi/?call=KE6O-15&mt=m&z=10&timerange=3600

http://aprs.fi/heard/KE6O-15 every station heard by KE6O-15

http://aprs.fi/gated/KE6O-15 every station gated by KE6O-15

On the left side of the aprs.fi page are some Icons

Pointer with a bar --->| widens screen shot

House with antenna takes you home

Red and Blue circle is coverage area (PHG) Power, Height,Gain

You can manually change the items in the PHG to reflect the correct coverage by doing some tests with a known good mobile
of about 5 to 10 watts , this may mean you have to decrease the Height or the antenna gain etc ..

http://aprs.fi/?call=zl2ks-3&mt=m&z=11&timerange=3600

If you look at our digi ZL2KS-3 this PHG has been tested on a requlr basis by a known good set up ZL2BK-9 who travels this
section of road up to 3 to 4 times a month. Cover age was checked with 1 watt and 5 watts

PHG calculators
http://www.apritch.myby.co.uk/phgrcalc.htm
http://www.nashvilleaprs.net/apps/phgcalc.php

PHG should only be used by Digi's or Igates that also digi .. Please don't set PHG in your Mobile

1 click = Blue = "rough" mobile coverage 2snd click =Red is for Hill top Digi "rough" coverage

A is the ruler to active click the A then move to a section on map click once wait for the Balloon to appear then drag
the balloons to the location you wish to measure.

To close all the above just click the Icon or in the case of the rulers click on 1 and it will ask in blue [delete ruler] click on that

There is also " Other Views "

Station info
Raw packets
Status packets - Beacon packets
Messages - Bulletin board
Prefix browsing
Google Earth KML [?]
Preferences

Remember to set your Preferences

The above should help many who want to know what features are available for sorting out coverage problems, tracker problems etc.

Enjoy the service of APRS.FI, its a great tool, someone close, send that man a beer ..

Hi Wayne,
Are you Txing ? if the APRS-IS hasn't had a posit
from you then it won't up date.

If that posit shown as
http://aprs.fi/?call=N1CKM-2&mt=m&z=11&timerange=3600

then from this it appears that the tracker gave a data posit on the
24/06/2009 and hasn't been seen since..

When was the last time you checked you own posits and also gear ?

By the way, what is "IT"? If I had to guess from the Mic-E packets and the appearance of doing messaging, it might be a Kenwood D7, but I'm not sure. If you don't feed "it" GPS, "it" won't feed your current position to APRS.

Lynn (D) - KJ4ERJ

PS. That list of packets I just posted includes message traffic and acks. They didn't all come from "it".

Both APRS.FI and Findu.com have you in the same place, so it is not an APRS.FI problem.

You data is 7 days old. This is the data from Findu.com:
Position of N1CKM-2 --- 6.9 miles northwest of New Kensington, PA --- Report received 7 days 1 hours 23 minutes 31 seconds ago Mic-E message 1, En Route
Raw packet: N1CKM-2>TP3W6T,WX4GSO-9*,WIDE,qAR,WA4SAS-11:'kPFl k/]"3r}

I can see the WX4GSO-9 heard you. And that site is in the right place.

For starters, check your settings.

Best regards,
Fred

Guess updated: APK101 is supposedly a Kenwood D700, but I suspect the
D710 may use the same ToCall?

Lynn (D) - KJ4ERJ - Nothing like responding to your own posts...

I fixed the relay wide a few days ago - sorry to be so dinosaur :)

And I may not have had the GPS on when I sent those position reports to WLNK-1. I'll fix that too when I drive that vehicle the next time.

After that I hope I will be able to use the APRSLink. I can't seem to get any messages through or back to me.

thanks - I am still learning.

Can you suggest which settings to check? I have been through those a dozen times with the book and don't see anything unusual.

appreciate your assistance.

Both APRS.FI and Findu.com have you in the same place, so it is not an APRS.FI problem.

You data is 7 days old. This is the data from Findu.com:
Position of N1CKM-2 --- 6.9 miles northwest of New Kensington, PA --- Report received 7 days 1 hours 23 minutes 31 seconds ago Mic-E message 1, En Route
Raw packet: N1CKM-2>TP3W6T,WX4GSO-9*,WIDE,qAR,WA4SAS-11:'kPFl k/]"3r}

I can see the WX4GSO-9 heard you. And that site is in the right place.

For starters, check your settings.

Best regards,
Fred

By the way, what is "IT"? If I had to guess from the Mic-E packets and the appearance of doing messaging, it might be a Kenwood D7, but I'm not sure. If you don't feed "it" GPS, "it" won't feed your current position to APRS.

Lynn (D) - KJ4ERJ

PS. That list of packets I just posted includes message traffic and acks. They didn't all come from "it".

You'll benefit from that change. There's very few RELAY/WIDE digis in
the US these days (thankfully).
> And I may not have had the GPS on when I sent those position reports to WLNK-1. I'll fix
that too when I drive that vehicle the next time.
>
That would certainly cause what you're seeing here.
> After that I hope I will be able to use the APRSLink. I can't seem to get any messages
through or back to me.
>
2009-06-24 06:53:26 N1CKM-2>APK101,RELAY,WIDE,WIDE,qAR,WW6JC-2::WLNK-1
:G /EX{9

2009-06-24 06:53:27 WLNK-1>APRS,TCPIP*,qAC,T2NUENGLD::N1CKM-2 :ack9

That was a message from you to WLNK-1 saying G /EX. It received the
message and sent back the requested ({9) ack (ack9). I do not know if
the D700 retransmits if an ack is not received, so I don't know if you
actually received the ack or not.

2009-06-24 06:53:27 WLNK-1>APRS,TCPIP*,qAC,T2NUENGLD::N1CKM-2 :No
position report received for your station.{376
2009-06-24 06:54:27 WLNK-1>APRS,TCPIP*,qAC,T2NUENGLD::N1CKM-2 :No
position report received for your station.{376
2009-06-24 06:56:27 WLNK-1>APRS,TCPIP*,qAC,T2NUENGLD::N1CKM-2 :No
position report received for your station.{376
2009-06-24 07:00:27 WLNK-1>APRS,TCPIP*,qAC,T2NUENGLD::N1CKM-2 :No
position report received for your station.{376

This appears to be WLNK-1 telling you that it hasn't received a position
report and asking for an ack ({376) that your station did not issue
causing WLNK-1 to go into a decaying retransmission for a while (1, 2, 4
minute delays).

I'm pretty sure the D700 auto-acks messages, so it's likely that this
message never got to you. This sort of says that the previous ack
didn't get to you either. Do you know if WW6JC-2 is a bi-directional
IGate? If it is receive-only (not a good configuration), this is the
behavior you would see.

2009-06-24 07:15:28 N1CKM-2>APK101,RELAY,WIDE,WIDE,qAR,W4DEX::WLNK-1 :I
/EX{A
2009-06-24 07:15:28 WLNK-1>APRS,TCPIP*,qAC,T2NUENGLD::N1CKM-2 :ackA
2009-06-24 07:17:39 N1CKM-2>APK101,WX4GSO-9*,WIDE,WIDE,qAR,W4DEX::WLNK-1

:I /EX{A
2009-06-24 07:17:39 WLNK-1>APRS,TCPIP*,qAC,T2NUENGLD::N1CKM-2 :ackA

This is another message from you to WLNK-1 requesting ack. It was heard
direct by W4DEX and subsequently heard (2 minutes later?) by WX4GSO-9
gated through W4DEX also. WLNK-1 issued an ack, but again, we don't
know if your radio actually received it. Does anyone know if D700
auto-retransmits when missing acks? And does it auto-ack messages?

2009-06-24 06:59:06

VE1WRG-3>APU25N,TCPIP*,qAC,T2NUENGLD:;NETACTIVE*241119z4505.09N/06428.74WIN1CKM-2

Not being familiar with WinLink, I'm not sure what VE1WRG-3 was trying
to do, but it appears that it was trying to provide a coordinate update
for your station from something. Is anyone out there familiar with
NETACTIVE?

2009-06-24 07:30:57 N1CKM-2>TP3W6T,RELAY,WIDE,qAR,W4DEX:'kPFl ?k/]"3r}
2009-06-24 07:32:27 N1CKM-2>TP3W6T,WX4GSO-9*,WIDE,qAR,WA4SAS-11:'kPFl
?k/]"3r}

These are an actual Mic-E position update from your D700. This should
have caused W4DEX to definitely mark you as a local station for gating
messages from Internet to RF if it is so configured. Also, depending on
the configuration (particularly the definition of "local") of WA4SAS-11,
it may have also been capable of gating messages back to you after this
point. However, all of the messaging was done prior to this point, so
we don't know if they'd have done so after this or not.

I also don't know what these messages are nor why W4DEX would have
suddenly decided that you were a DX:. Other than it may have triggered
off of the difference between your (supposed) coordinates and the
receiving IGate/Digi coordinates. That would have been about 370 miles
or so if I guess correctly.

> thanks - I am still learning.
>
As am I. I post my understanding of things to questions like your's
both to hopefully answer them as well as to have my answer possibly
corrected by someone that understands more/differently than I do!

(Reposting with hopefully better formatting)

Questions asked below:

1) Does the D700 auto-retransmit messages until receiving an ack?

2) Does the D700 auto-transmit an ack when a message is received?

3) What is "NETACTIVE" and why would it be assisting with position
updates for WinLink?

4) What is W4DEX's messages about DX: over APRS when a station appeared
to be 371 miles from transmission to reception?

Wayne W. Santos wrote:
> I fixed the relay wide a few days ago - sorry to be so dinosaur :)

You'll benefit from that change. There's very few RELAY/WIDE digis in
the US these days (thankfully).

> And I may not have had the GPS on when I sent those position reports to WLNK-1. I'll fix
that too when I drive that vehicle the next time.
>

That would certainly cause what you're seeing here.

> After that I hope I will be able to use the APRSLink. I can't seem to get any messages
through or back to me.
>

2009-06-24 06:53:26 N1CKM-2>APK101,RELAY,WIDE,WIDE,qAR,WW6JC-2::WLNK-1:G
/EX{9
2009-06-24 06:53:27 WLNK-1>APRS,TCPIP*,qAC,T2NUENGLD::N1CKM-2 :ack9

That was a message from you to WLNK-1 saying G /EX. It received the
message and sent back the requested ({9) ack (ack9). I do not know if
the D700 retransmits if an ack is not received, so I don't know if you
actually received the ack or not.

2009-06-24 06:53:27 WLNK-1>APRS,TCPIP*,qAC,T2NUENGLD::N1CKM-2 :No
position report received for your station.{376
2009-06-24 06:54:27 WLNK-1>APRS,TCPIP*,qAC,T2NUENGLD::N1CKM-2 :No
position report received for your station.{376
2009-06-24 06:56:27 WLNK-1>APRS,TCPIP*,qAC,T2NUENGLD::N1CKM-2 :No
position report received for your station.{376
2009-06-24 07:00:27 WLNK-1>APRS,TCPIP*,qAC,T2NUENGLD::N1CKM-2 :No
position report received for your station.{376

This appears to be WLNK-1 telling you that it hasn't received a position report and asking for an ack ({376) that your station did not issue causing WLNK-1 to go into a decaying retransmission for a while (1, 2, 4 minute delays).

I'm pretty sure the D700 auto-acks messages, so it's likely that this message never got to you. This sort of says that the previous ack didn't get to you either. Do you know if WW6JC-2 is a bi-directional IGate? If it is receive-only (not a good configuration), this is the behavior you would see.

2009-06-24 07:15:28 N1CKM-2>APK101,RELAY,WIDE,WIDE,qAR,W4DEX::WLNK-1 :I /EX{A
2009-06-24 07:15:28 WLNK-1>APRS,TCPIP*,qAC,T2NUENGLD::N1CKM-2 :ackA
2009-06-24 07:17:39 N1CKM-2>APK101,WX4GSO-9*,WIDE,WIDE,qAR,W4DEX::WLNK-1 :I /EX{A
2009-06-24 07:17:39 WLNK-1>APRS,TCPIP*,qAC,T2NUENGLD::N1CKM-2 :ackA

This is another message from you to WLNK-1 requesting ack. It was heard direct by W4DEX and subsequently heard (2 minutes later?) by WX4GSO-9 gated through W4DEX also. WLNK-1 issued an ack, but again, we don't know if your radio actually received it. Does anyone know if D700 auto-retransmits when missing acks? And does it auto-ack messages?

Not being familiar with WinLink, I'm not sure what VE1WRG-3 was trying to do, but it appears that it was trying to provide a coordinate update for your station from something. Is anyone out there familiar with NETACTIVE?

2009-06-24 07:30:57 N1CKM-2>TP3W6T,RELAY,WIDE,qAR,W4DEX:'kPFl ?k/]"3r}
2009-06-24 07:32:27 N1CKM-2>TP3W6T,WX4GSO-9*,WIDE,qAR,WA4SAS-11:'kPFl ?k/]"3r}

These are an actual Mic-E position update from your D700. This should have caused W4DEX to definitely mark you as a local station for gating messages from Internet to RF if it is so configured. Also, depending on

the configuration (particularly the definition of "local") of WA4SAS-11, it may have also been capable of gating messages back to you after this point. However, all of the messaging was done prior to this point, so we don't know if they'd have done so after this or not.

I also don't know what these messages are nor why W4DEX would have suddenly decided that you were a DX:. Other than it may have triggered off of the difference between your (supposed) coordinates and the receiving IGate/Digi coordinates. That would have been about 370 miles or so if I guess correctly.

> thanks - I am still learning.
>

As am I. I post my understanding of things to questions like your's both to hopefully answer them as well as to have my answer possibly corrected by someone that understands more/differently than I do!

Lynn (D) - KJ4ERJ - TT4 IGate as KJ4ERJ-2/-7 - T2-135 as KJ4ERJ-9 - AT&T Tilt as KJ4ERJ-12 (-IS only)

6300. Need parameters for KPC-3+ in tracker mode.

From: Dick True
Topic: 6300 Message: 6300

I need the complete setup parameters for a KPC-3+ at Ver 390 or 391 that is used in a vehicle for APRS tracker mode. NOT a Digi or WX station just an ordinary tracker with GPS input. It would help a great deal with a problem I am having with my setup.

From: David - KG4ZLB
Topic: 6300 Message: 6301

Can anyone help me with this?

I have successfully sent an e-mail through the APRS system to someone in my area and also to myself.

I have also sent a message to a call sign successfully.

So far so good!

Question is, is it possible to send a call sign based message to an overseas ham? I have tried sending to a UK ham but he has not received it!

Is it possible or is it beyond the scope of what APRS can do right now?

Many thanks

Depends... Is the overseas ham on APRS? Are they near to an igate?
Is the igate set up to be a two-way or a one-way igate?

If they're on APRS you should be able to test out the system easily
enough.

OK. I've got my igate and digipeater up and running. However:

- If a station goes through the gate and digipeater, it shows up correctly on a map in, say, aprs.fi. But if you point to the station that just went through, it shows W2TRR-0 as the gate/digi point, but the map doesn't draw a line from the vehicle to my home. Additionally, if you look through the raw data on that call sign, I note that W2TRR-0 is not highlighted in the list, where in data before and after my station has picked up this vehicle, others are.

- When I initially set up the igate, I put in the lat/lon coordinates given for my location on QRZ.com. Looking at the map, that puts me across the street and on the other side of the train tracks (where there is no street or anything else) - and you can easily see this on aprs.fi. So out came a GPS and I got the real coordinates, which agree with the pointer on aprs.fi for where my house should be. I input this information - which shows up correctly in the raw data, yet my icon still shows up literally on the wrong side of the tracks.

Obviously, with the first item, there's something I need to do that I'm not. With the second, I'm stumped. Do I need to shut it down for a couple of days to let the database clear out a bit?

Sorry, to tired to look at the first issue.
But the second one, as you will find out, gps isn't very accurate, and what is even worse in lots of cases, is how accurate one map is to another. I have notices anywhere from 5-50 feet differences between using like, yahoo maps, google maps, microsoft mappoint, aprs.fi. Some of them are exactly the same, but that is only cause they used the same data from the same map people, the ones that are different, used different map people, and therefor have different ideas of exact locations, and the accuracy of those locations.

The first part seems to be cause your station is using W2TRR-0 instead
of W2TRR for the igate call. Those are suppost to mean the same thing
on ax25, but maybe they are different on aprs-is, atleast they are
being treated differently with the aprs.fi code.

I don't think that's the problem - when I park my car in the driveway, its icon shows up exactly where it should be. The house icon is being shown on the coordinates I input the first time I fired the computer up. I corrected the coordinates - which agree with where the car is parked - but the house hasn't moved, even though the raw data is and has been showing the correct coordinates.

I have to differ with "the raw data is and has been showing the correct coordinates". If your car (W2TRR-9) is at the correct coordinates, your house (W2TRR) is further east. Here's two recent raw packets from aprs.fi.

2009-07-04 15:10:07 UTC:
W2TRR-9>APT311,WIDE1-1,WIDE2-1,qAR,W2TRR-0:/041510z4127.04N/07406.47W>331/000/A=000485

2009-07-05 15:48:04 UTC:
W2TRR>APU25N,WIDE1-1,WIDE2-2,qAR,W2TRR-0:=4127.03N/07406.29W-PHG75002 - 50W Digi, I-gate {UIV32N}

You just need to figure out where the 74 06.29W is coming from and fix it in there. Probably in a UI-View configuration dialog somewhere.

You might want to post this to the UI-View group if you don't manage to get it changed to what you want it.

You're right, Lynn. Right in front of me and I didn't see it. I input the numbers as listed by the car and we're in business.

I also took out the -0 from the ID and I now get lines drawn to the location.

Thanks for the assistance, everyone!

http://www.tapr.org/psr.html

-----Original Message-----
From: Stan Horzepa <stanzepa@...>
To: tapr-announce@tapr.org
Sent: Mon, Jul 6, 2009 8:07 pm
Subject: [tapr-announce] write now

This is Stan announcing that the TAPR editorial board is now considering articles for the Summer issue of our quarterly newsletter, Packet Status Register (PSR). If you would like to submit anything for PSR, please e-mail it to me, your PSR editor, as soon as possible. (The PSR deadline is July 31.)

Remember, each piece that is published in PSR extends your TAPR membership by three months!

73,

Stan Horzepa, WA1LOU, PSR Editor

The problem with bluetooth is that you wind up with batteries in
everything, and keeping it all running gets to be a pain.

The only place I want bluetooth (or ant) is between my tracker and my
handheld, mapping GPS receiver.

Pair a TinyTrak4 with a "cable replacement" Bluetooth to Serial converter and you can have a BT TNC today! I'm running mine that way to isolate the RF-connected hardware from my APRS-IS server. Nothing like a 60 foot air connection for isolation!

6314. Dynamic Maps For UI-View

Yahoo group: APRS (2007 — 2010)
Date: 2009-07-09 13:43:16 UTC
From: wa5up_ham
Topic: 6314 Message: 6314

Hello,

I am running UI-View with my TS-2000. Everything is working fine, and I'm currently using some static maps of my area. I'd like to be able to use dynamic maps that would allow me to pan and zoom. Also I really want to be able to overlay weather radar maps as well. Can someone give me specific instructions on how to do this? Any help is appreciated.

Andy Knepler - WA5UP

www.wa5up.com

These uTNT bluetooth have been around for awhile now.

http://www.elcomresearch.com/shop/item.aspx?itemid=2

I'm with scott on them, battery life being an issue. I guess if you
wanted to tower mount your radio adding one of these would work, then
it's on constant power, and just using bluetooth to access it).

Does this cable work with the Garmin Street pilot 7200 model? How do I find out which of the gps's will work. Seems there should be more than the few items listed on the Argent Data's web page for the adapter cable. Additionally how I find out which GPS's output the correct information to use with the Kenwwood radios.-Dave N0XBN

On the linked page it does include the 7000 series, so yes, the 7200
will work. It does create duplicate waypoints for moving stations, though.

Dave,

It kind of works with the 7000 series GPS receivers from Garmin, but not very well. It will give you confusing waypoints, and generally frustrate you. You would be happier using it with a Nuvi 350, but you won't be really happy unless you buy an Avmap G5, which is the only GPS really made to work with APRS. The problem with the Street Pilot and the adaptor cable from Argent is not in Scott's adaptor. Garmin just is not open to software improvements that would make his adaptor useful with most of the Garmin units.

Scott has had some luck talking Garmin into integrating some new APRS features into recent models. This is great and shows that Garmin is maybe starting to listen to the users, with Scott's push.

The question that remains to be answered is if Garmin will go back and update the firmware for some slightly older units. MAYBE as far back as the eTrex series, deff. the 60C series. I would personally like to see the 176C/276C get a "facelift" :o)

I have been looking at the 7200 myself. Brand new on eBay for $332. Its tempting to get one and at least try it. Even if it doesn't work well for APRS, you still get one hell of a nice GPS with color maps, nav and a huge touchscreen.

6324. APRS and the Internet (Question)

Yahoo group: APRS (2007 — 2010)
Date: 2009-07-10 03:40:23 UTC
From: KC5RHB
Topic: 6324 Message: 6324

Hello,

By no means am I'm trying to steer away from the traditional use of APRS, its just right now I cant really afford a new radio, or the Tiny Track stuff, nor do I have anymore room for mounting stuff.

I was wanting to know if there was a way to use APRS to send my position via the internet and a GPS receiver? (no radio)

I recently saw you can now use APRS with an iphone, so I figured there may be a way to do it with the internet and a GPS receiver.

I pretty much want to use APRS when I'm out storm spotting so the NWS can see my location.

And I'm sure someday down the road I will get a "real" APRS system, just cant right now.

Thanks, 73,

David, KC5RHB

What do you have for an Internet connection while you're out storm spotting? If you have a Windows Mobile phone with an unlimited data plan and internal GPS, there's APRSISCE, an APRS-IS client developed for that platform. Check out http://groups.yahoo.com/group/aprsisce/join for a copy of the beta. And check out KJ4ERJ-12 on your favorite APRS-IS viewing site for a live user.

6326. Garmin Street Pilot 7200

Yahoo group: APRS (2007 — 2010)
Date: 2009-07-10 21:59:26 UTC
From: Dave
Topic: 6326 Message: 6326

I just recieved a Streetpilot 7200 today. This not a small unit. You don't grasp how big 7" is until you take out of the box and set it on your dash. Gameboys aren't this big. When I originally researched this GPS there was a comment on Amazon.com about the map display. The writer said it didn't label the streets on the map display. The one I got does as well as telling you what direction and street you're on. There a lot of features to this unit that you proably won't use. Like being a monitor for a dvd player. I'm waiting on the cable form Argent Data to see how this does on APRS. There was some comments about it showing duplicate waypoints. I'll see in few days once I get the cable how mine does compared to what others have reported. Dave N0XBN

Dave,

I am looking forward to hearing what you find in your testing. I have been looking at a 7200 for a while, but heard some of the same complaints you mentioned and was on the fence about spending the money. I am an Argent Data reseller, so I have a few of the GTRANS cables in stock. That makes it all the more tempting to buy the GPS :o)

I used to have a 7" Liliput touchscreen LCD for my carputer and I know that it was quite a bit larger than any GPS I have ever owned. I think the size is made up for by the touchscreen and overall function.

There are also the OpenTracker products plus AGWPE or "soundmodem" which are soundcard TNC's for different OS'es, so you may be able to do something on-the-cheap.

Another possibility is to use an OpenTracker or TinyTrak on your normal voice radio as long as the repeaters out there have Mic-E capability: You can set up to do a tone burst with your position every time you unkey. Again, this depends on somebody decoding your positions off those bursts and putting them onto 144.39 and/or gating them to the internet. This way one radio does double-duty.

> I was wanting to know if there was a way to use APRS to send my
> position via the internet and a GPS receiver? (no radio).

Yep. What OS? Many of the APRS programs can accept your position from a GPS and inject your APRS packets into the internet. The key is having a connection to the internet from your laptop. 802.11 probably won't work because you're mobile and it's a short-range medium, so cell-phone wireless cards might be your only option. Might as well buy a used 2-meter radio and an Opentracker, save money.

If you're in a serious storm area (tornadoes and the like) then you might be in a position where the cell-site infrastructure is down or unreliable. Again RF is a win.

Go to the first link listed below (Eskimo) and look on the left. There's a link there to the APRS Client Capabilities Chart. That lists a bunch of the APRS software that's available. There's also http://info.aprs.net at the "Software" link.

I have been looking at a 7200 for a while, but heard some of the same complaints you mentioned and was on the fence about spending the money. I am an Argent Data reseller, so I have a few of the GTRANS cables in stock. That makes it all the more tempting to buy the GPS :o)

> I was wanting to know if there was a way to use APRS
> to send my position via the internet and a GPS receiver?

I occassionally send posts to FindU.Com via my mobile phone web browser. Instructions can be found at:
http://www.findu.com/cgi.html#inputpos

For example, This evening I plan to be at Space View Park in Titusville FL for the Space Shuttle launch. I pull up the web page (bookmarked only, not linked to from any web page so Search Engines can't find it) with my "usual destinations", and clicked on "Space View Park".
http://map.findu.com/n4scy-9
http://www.findu.com/cgi-bin/inputpos.cgi?call=n4scy-9&passwd=xxxx&lat=28.613475&lon=-80.804876&icon=/%3E

Places don't move very often, so I don't need a GPS to know where my usual haunts are located. Notice that you can attach the icon of your choice. Since a "-9" call sign is supposed to be a car, I used the car icon for this location. The pass word goes over the public internet in unencrypted form, so don't use anything you use for real security. This web site is the only place where I use the letters "aprs" as a pass word. Because of the pass word requirement, registration is required.

The cgi.html page is worth reading over. It's amazing what's in there!

You would be happier using it with a Nuvi 350, but you won't be really happy unless you buy an Avmap G5, which is the only GPS really made to work with APRS. The problem with the Street Pilot and the adaptor cable from Argent is not in Scott's adaptor. Garmin just is not open to software improvements that would make his adaptor useful with most of the Garmin units.

Cross posted from the APRSSIG:

-----Original Message-----

QST APRS operators in E-TN, SW-VA or W-NC:

We may need a new volunteer on Roan Mountain.

The present team (a club) made the mistake of asking for permission to do an "event", and may be embrolied in bureaucracy or have to pay a $100 "event" application fee. This may be a dead end.
http://aprs.org/hamtrails/roan.html

BUT this is -not- an event in the sense that the park ranger is interpreting it, it is ONE person, one car parked in a parking lot with a D700 mobile radio. There is no way this is illegal or in any way impacting the park which has room for problaby 200 cars plus a half dozen buses in this parking lot!

But I can see the hesitancy of the club to then go do it once they have opened pandoras box and been "denied" an "event"..

So all we need is an APRS mobile with a D700 to go park there for the 4 hour period.

Even better, would be someone with a D700, and an 8 amp-hr battery to go hike 100 yards into the woods and put the radio at the highest point that is totally hidden by trees and not part of where the public goes. Here is my latest post to the Roan Team:

From: KC5RHB
Topic: 6324 Message: 6334

Thanks everyone for the replies. I'm using XP and an unlimited air card "broadband"(Sprint) going on 2 years now, and have an GPS receiver antenna that runs my mapping software, Spotter Network, Radar GPS and stuff. I was trying to see if there was an app for my Blackberry for APRS but cant find one. A friend of mine has an iphone and the APRS app for that phone works great. But all I'm really wanting is to send my position only, so the NWS, EOC's and other spotters can see my position. I'm not into the messaging stuff yet. I just wanted to get something simple up and going for now.

Once again thanks for the replies, 73

6335. Anyone know all the "-" for APRS use?

Yahoo group: APRS (2007 — 2010)
Date: 2009-07-12 19:49:17 UTC
From: Jeffrey
Topic: 6335 Message: 6335

Can anyone tell where I can located the info page that explains which "-" to use for my home station. My home is my callsign and my mobile is my call -9. Well, a while back I show something online that explained what all the "-" meant. I know -9 is used for mobiles but what does the -1 -2 -3 -4 -5 -6 -7 -8 -10 and so on stand for.

Please let me know because I want to change my home station to a -# but don't know which to use for proper procedure.

Jeffrey

I have found that this subject can lead to some pretty heated arguments!

Reagrdless, when I was living in Virginia Beach, VA, we had adopted this SSID plan:

NONE Primary Home
-1 Secondary Home
-2 Special Event
-3 Place of Education ie. School, University, YMCA, ect.
-4 iGate Only
-5 Primary Digipeater
-6 Secondary Digipeater
-7 Kenwood D7 or D700
-8 ARES/RACES/CERT Units
-9 Primary Weather Station
-10 Secondary Weather Station
-11 Internet Feed Only Station (Not RF Capable)
-12 Maritime (Messaging Capable)
-13 Maritime (Non Messaging Capable)
-14 Secondary Mobile (Non-Kenwood, Non-Maritime)
-15 Primary Mobile (Non-Kenwood, Non-Maritime)

Most agreed with it, some did not. I know there are MANY other SSID plans floating around and everyone claims to have the "correct" one. We never claimed ours to be correct for everyone, but it just worked well for our area. Obviously, where you live geograpically has a big impact on this.

For example, if you live in Kansas City, MO. maritime stations may not be on the top of your list :o)

APRS SSID Guide

Since there are 20,000 APRS users on the air, the APRS maps and data can get very cluttered. Also, most operators have multiple stations on the air, such as their HOME, CAR, BOAT, and HT. It is very convenient to be able to recognize these typical applications at a glance.

Here are those common defaults:

-0 Home Station, Home Station running IGate.
-1 Digipeater, Home Station running a WIDEn-N Digi, Wx Digipeater
-2 Digipeater [#2 or] on 70CM
-3 Digipeater [#3]
-4 HF to VHF Gateway
-5 IGate (Not home station)
-6 Operations via Satellite
-7 Kenwood D7 HH
-8 is for boats, sailboats and ships (maybe 802.11 in the future)
-9 is for Mobiles
-10 is for operation via The internet only
-11 is for APRStouch-tone users (and the occasional Balloons)
-12 Portable Units such as Laptops, Camp Sites etc.
-14 is for Truckers
-15 is for HF

Originally, in 1992, the first APRS GPS mobiles just transmitted raw NMEA-0183 GPS stings and so there was no way to insert a SYMBOL byte in the pre-formatted NMEA 183 packet. Hence we defined 14 common SYMBOLs as defaults to the 14 available SSID's that a mobile could use. These included BIKES, HELICOPTERS, AIRCRAFT, VANS and many others in addition to the ones above. This is now OBSOLETE.

In the late 1990's we came up with a better solution and defined the AX.25 TOCALL of GPSxyz for such use. In this case, the "xyz" characters can be used to define any of the hundreds of APRS symbols including Overlays. Just look up the xyz in the SYMBOLS.TXT file included in all copies of APRSdos (or these days, on the WEB).

Since this GPSxyz concept was so powerful, it completely replaced the original SSID assignments and so those original NMEA defaults have been removed from the Documentation.

However the convention for the 6 most useful ones remains and should be used in the absesnce of any other overriding conditions. Except for the TH-D7 and Truckers, the other SSID conventions mark APRS "TYPES" of users that are independent of the many SYMBOLS they can use. Thus it is nice to know HOW someone is getting into the system, whether via satellite,

HF, the internet, or touchtone. For example, using the -6 only for Space applications is so that the global APRS WEB data bases will keep statistics and data for when you are operating through the satellites separate from when you are working normally.

So stick to the standards above for the obvious applications... Of course these are not rigid. If you have more than 4 digipeaters, use any SSID you want.
These are only guidelines...

I'm running the following in East Central Florida:

KJ4ERJ was my original home-based IGate (javAPRSsrvr)

KJ4ERJ-2 is my current IGate (javAPRSsrvr)
KJ4ERJ-6 is the javAPRSsrvr logon for -2
KJ4ERJ-7 is the my TinyTrak4 on ICom HT as the RF for -2

KJ4ERJ-8 is my temporary mobile (Kenwood D7)
KJ4ERJ-9 is my primary mobile (T2-135)
KJ4ERJ-12 is my AT&T Tilt over APRS-IS (non-RF)
KJ4ERJ-14 is my Safari van mobile (T2-135)

In other words, outside of the null SSID for your home station and -9 as
a mobile, you're kind of on your own.

I

Help.
I have been unsucessful in passing bouncing APRS message off of the ARISS. I have seen the setups for the D7 handheld but not for the D700 or I have missed the needed information. I have a nice shot about a week ago but the only thing I could seem to do at 3am was just listen. I was seeing traffic from PA, MD but that was about it.

I have no external TNC only what the radio has to offer with a 6 dbi gain antenna on the roof of my truck.

Maybe you have too much gain on your antenna?
I haven't been paying attention to ariss lately, but the do like to
jumble the freqs used a lot. Maybe I will take a listen and see.

You should have ARISS set as your first path element, for it to digi it.

Changing the antenna isn't a problem at all. I did change my power to 5 watts and bumped it up one setting to see if it would help.
I did put ARISS in the UIDIGI path.
I read in some ones article UIDIGI ARISS,WIDE2-2,SGATE
I may have had it wrong. I'm still thinking a config issue.
Some day I'll bounce off of them.

I recieved the cable today from Argent Data.. Initial results are encouraging I did not see any duplicate waypoints so far. All stations recevied show only one position. I'm not sure what was meant by duplicate positions. I'll have to play with it some more. I like it but I'm not sure I want that big a screen sitting on my dash. I still need to figure out how you move the cursor around on the screen..

It'll only show duplicates for stations that move - the previous
position will be left behind.

The duplicate "bug" is kind of a feature in a way for APRS since it leaves a breadcrumb trail for moving stations. The bad part is, when you want to delete them, you either have to delete every one individually or do a mass delete of all waypoints and start fresh. When it comes down to it, if you have 10-20+ moving stations on the map, a mass delete may not be that big of a deal. Especially if they are active, they are going to show back up in a matter of minutes.

I am tempted to get a 7200!

The main site is http://aprs.org

Though, the original text files, when printed out, is about 2
inches thick.
Everything is there, but it is not organized for the newcomer,
since it is moreor less organized chronologically, with new
stuff added at the top.

For example upcoming events, APRS on the Appalahian Trail event
on 26 July:
www.aprs.org/at-golden-packet.html

Greetings,

I am in kind of the same boat. I have always been interested in APRS
but never really had the funds to set up my car with APRS until I picked
up a VX-8.

I have the bug now. I am thinking that I would like to set up a igate.
We don't have very good coverage in our area. Our town is trying to
set up a CERT.

My questions are:

1. What is the best software to start with? I can do Windows,
but prefer Linux. My Linux box is more stable than windows
(aren't they all).

Can someone point me to the general docs for igates?

How does the backbone work? Does a digit-repeater relay packets
to all the other igates?

2. What equipment do I need? I want to do it on the cheap.
How much power do I need. I am fairly high and once I get it
up and running I may move it to a friends which is very high.
I have some old 2m. One is a HT and the other is a mobile about 15
watts or so.

I am sure I will have more questions, but this is a good start.

Thanks and 73

Darryl,

Welcome to the wonderful world of APRS! I find it quite fun and
interesting and hope that you will to. Hobbies are meant to be fun!

> 1. What is the best software to start with? I can do Windows,
but prefer Linux. My Linux box is more stable than windows
(aren't they all).

I use javAPRSsrvr (a java application for Windoze and *nux). Look for
the javaprssrvr Yahoo Group which is the only way to get this free
software. It is the same software that runs the APRS-IS backbone servers.

> Can someone point me to the general docs for igates?

Never found any, but the documentation that comes with javAPRSsrvr
(along with a sample configuration file) goes a long way to understand
how to get it set up. It's really quite simple.

> How does the backbone work? Does a digit-repeater relay packets
to all the other igates?

The "backbone", or APRS-IS, is a simply a network of javAPRSsrvr
instances that exchange APRS packets that have been gated in from RF all
over the world by IGates. Newly received packets are relayed out to all
connected clients (provided they fit within the client's requested
filter) and propagate to all servers fairly quickly.

DigiPeaters (digital repeaters) only relay packets received on RF back
to RF for local reception. IGates either hear the packet directly or
via a digipeat and place it (gate it) to APRS-IS (the Internet). Good
IGates are bi-direction and also gate packets from the Internet to RF
for "local" stations. Most of the time "local" is defined as stations
that were heard either directly or via some small number of hops.

> 2. What equipment do I need? I want to do it on the cheap.
How much power do I need. I am fairly high and once I get it
up and running I may move it to a friends which is very high.
I have some old 2m. One is a HT and the other is a mobile about 15
watts or so.

You'll need a radio of some sort with suitable antenna, a TNC of some
sort, and a computer with an always-on Internet connection. How much
power you need depends on where you are and what coverage is already
there. The same factors determine if you should be only an IGate, only
a Digi (if you don't have Internet), or both.

I run an Icom 5 watt HT with a TinyTrak4 TNC on a 35' tower. You can see me as KJ4ERJ-7 (the TT4) or KJ4ERJ-2 (the IGate/Digi) on aprs.fi. I also use a Tracker2 (actually T2-135, KJ4ERJ-9 and KJ4ERJ-14) and have used AGWPEpro (a sound-card TNC) in the past. My son runs a KPC-3+ in his car (KJ4DXK-9) as well.

If you haven't viewed your area on aprs.fi or findu.com, that'd be the place to start. It'll give you an idea of the activity in your local area. If you provide me with a set of bounding coordinates, I can also provide a map of the APRS activity there over the past two weeks.

Lynn (D) - KI4ERJ - AT&T Tilt using APRSISCE for Windows Mobile as KJ4ERJ-12

Hi Darryl

For my igate I use javAPRS which can be found here....
http://www.aprs-is.net/javAPRSSrvr/
It's not open source but it works real well and is well suited for running on a linux box as it's all nicely console based and can be run as a daemon.

I run a small old Dell laptop, and use the sound card connected to a standard 2 meter radio via a RigBlaster NoMic which can be found here..
http://www.westmountainradio.com/
The rig blaster does some impedence matching on the audio and allows you to key the radio using a serial port.

Software in linux I use are the ax25-tools and the soundmodem package which are required to basically turn your soundcard in to a modem.

Everything on my setup is running in Ubuntu, but there's likely no problems with any other distros.

For info on the aprs backbone you should probably start here...
http://www.aprs-is.net/

6358. Central Illinois Balloon Launch, Saturday, 7/18 @ 8:50 am

Yahoo group: APRS (2007 — 2010)
Date: 2009-07-16 06:17:49 UTC
From: Mark Thompson
Topic: 6358 Message: 6358

QSO Opportunity with High Altitude Balloon Flight Saturday, 18 July 2009

As part of SpaceJam-3(www.spacejamboree.com),
DePauw University(www.depauw.edu/acad/physics/base) will be flying a cross band repeater to allow the Scouts at the Jamboree to talk with ground stations from a large area of the central portion of the United States.

Launch will occur at 13:50 UT (8:50 am Central Daylight Time) from Rantoul, IL (40.29 N, 88.14 W) The target ascent rate will be 1000 feet/min.

APRS information will be sent over 144.39 MHz every minute under the call sign, W9YJ-11.

The helium filled balloon will reach a float altitude of 70000 feet (21.5km) about 15:00 UT and will attempt to float at this altitude for about three hours. During this time the balloon should travel slowly to the NW from about 40.0N & 87.8W to 40.1 N & 88.1 W. The descent will begin about 18:00 UT on a slowly deflating balloon with landing about 19:30 UT.

The uplink frequency on the radio will be 144.36 MHz, and the downlink frequency will be 446.025 MHz.

The Scouts will be using the call sign WB9SA. If you have a chance to contact the station, the Scouts will be thrilled to make the contact! You may also attempt to use the repeater for a long distance Earth-Balloon-Earth contact with hams from larger distances.

Thanks to Howard Brooks, KC9QBN, Professor of Physics & Astronomy at DePauw University, W9YJ for making this happen!!!

If you are in the IL/IN area you might catch ATV from our first balloon going up (100,000 ft) at 8:20 AM CDT Saturday from Rantoul IL 430 Mhz, with a CW call "DE WB9SA"

A big thank you, to all the hams radio operators making www.spacejamboree.com the coolest Scout Technology event in the Central USA!!!!! THANK YOU Howard! Thank you VCARA, ARISS, ARRL Foundation Contributors, NASA, Richard Garriott, West Mountain Radio, PolyCom, 323.tv, Mike and Dave (our welders) and DePauw University.

73, and Make it a Tremendous Day,

Brian K Walker

For client software on Linux try "Xastir". For igate software
others have probably recommended the best option to you already.
Xastir can do simple igating but if you're only wanting to put up
an igate and not run client software/maps, use javaaprsserver.

> 2. What equipment do I need? I want to do it on the cheap.

> watts or so.

I saw recommendations to use a soundcard TNC. I'd probably
recommend against that for a solid igate system. I'd go with some
commercial hardware TNC in KISS mode. If you're running Xastir you
can then skip the Linux AX.25 configuration and go with the simple
"Serial KISS TNC" interface in Xastir. If using javaaprsserver or
if wishing to share the port among several apps, then you'll want to
set up a KISS TNC in Linux directly. We have a HOWTO for setting up
Linux AX.25 on the Xastir web pages. See below.

This is directed at ALL those who Maintain / HOST APRS info on the WWW..

The New WIDEN-n paradigm is now an accepted standard so Please Update those
so outdated web sites or remove the old pages
there is nothing more confusing to a new APRS operator than reading
information that is of no use or out dated.

If you all took the time to post this info when it was current one would
hope that YOU would keep it current !!!

Finally? No, that would have been www.mologogo.com here in the US at least five years ago. Their problem is that their system only uses Nextel prepaid phones ($10 month for all the data you can eat) which have a limited service area. But, five years ago, those were about the only phones sold in the US market that had full GPS devices onboard them. (As opposed to agps or locked out gps.)

"Two guys in a basement" syndrome, but the product has been out there, performing, and free to all except for the phone's charges. The amazing thing is that no one else has tried to compete with it before.

6365. APRS on flight to Oshkosh

Yahoo group: APRS (2007 — 2010)
Date: 2009-07-19 09:38:17 UTC
From: Brent Taylor
Topic: 6365 Message: 6365

We are flying our aircraft, a 1969 Piper Cherokee 140, from Charlottetown PEI to Oshkosh, WI, this coming week for next week's annual "Airventure" gathering.

I'll be taking along my MT-AIO. The routing will depend on weather for the day of departure (we will be VFR). Either south through Bangor, ME, and then on through the upper midwest, south of Chicago and then up to Oshkosh; or we"ll be flying via Montreal westward to Sault-Sainte-Marie and southward from there.

If we take the US routing I expect 144.39 coverage mght be better than it will through northern Ontario, but we'll see!

I have not installed an external antenna on the plane, as in testing the practice of simply sitting the tracker on the dash of the plane under the front windshield seems to work very well. I guess we'll see over the long haul.

The purpose is mainly to allow our wives to keep track of us on the flight.

The ID will be VY2HF-9, and the data packet will also include the registration of the plane, C-FGJZ and our overall routing, CYYG-KOSH.

After reading FAQs and other resources I'm guessing my best config is WIDE1-1 only, with 2-minute intervals, but I'd appreciate any input from the group whether that is truly the best config for our type of trip and the routing we may be on.

Thanks!

Brent Taylor, VY2HF

Greetings,

To all the digipeater operators out there: A BIG THANKS!

I just got back from a whirlwind trip NH-AR-NH. The family was able to keep tabs. Of course the cell phone was there, but not nearly as much fun.

Also, made my first VOICE ALERT contact on Thursday. That was fun! The VOICE ALERT is a fine idea. Hopefully others will set up for it on their trips. Maybe we will make contact too.

My mistake was forgetting my travel log (voice recorder). Things to record in the future: time, date, location (mile marker?) and of course the contact. After the QSO I scrambled to find a pen, paper and remember everything. The back of a receipt had to do the trick. ;)

Best regards,
Fred, N7FMH-9

Hi Teddy!
Voice Alert is a practice of programming a 100Hz tone into your rig
and setting you rig up to decode a 100hz tone as well. If another APRS
station is within simplex range you will hear his packet and then you
can call him briefly and ask him/her to switch frequencies for a QSO.
I use this function and I would recommend it as a must have.

Please no. And if you can remember where you saw such information, let us know. It is wrong.

WIDE1-1 is never to be used at altitude. It brings up every single WIDE1-1 completely opposite of the intent of a WIDE1-1 digi. WIDE1-1's are for fill in and are not supposed to respond to anything but a local signal needing some help.

Doing WIDE1-1 from altitude, or anywhere other than the first hop in a path (the same thing) unnecessarily adds QRM to the network.

Now if you only want one-hop, that is what you are after... Use WIDE2-1 which will give you the same thing but not bring up all those unwanted WIDE1-1 digi's.

Help us stamp out old/bad information. If you know where you got that receommendation, let's get it changed.

Bob

I have APRS on my 2001 Cessna T182T, but I have an external antenna installed. The antenna is a wide band Comnant so I could use it as an aviation backup and HAM radio. The radio is one of the few Vertex Standard VXA700 that does both aviation and HAM. The radio can be used standalone or via the audio panel through a jack on the instrument panel. My setup is either a GPS puck or a Nuvi 350, depending on what my needs are going to be, and an OT2. I have a strip of velcro to mount either to the dash. I have a temporary bracket on the instrument for the radio.

I fly from Everett, WA to places in Oregon and Idaho. The digipeater coverage is good in the NW, but I still have times when my beacon does not get received, or at least sent through an IGATE. I started out using WIDE1-1, but found that the best for me was to use WIDE1-1, WIDE2-1. You can check arps.fi for K7YBZ-4 and you can check out several flights and see what kind of success I had.

You will note I fly IFR but I have not had any noticeable interference to my avionics. I did have to add ferrite beads to the power cables to prevent noise from the strobe lights getting into the OT2 and the Nuvi when used. The GPS puck is a Garmin GPS-16x-HVS which is RFI/EMI immune and has an optional mag mount that can be removed so as not to interfere with the compass when placed on the dash but can be used in another application.

I have the OT2 programmed for smartbeaconing with 5 mph at 300 seconds and 120 mph at 90 seconds. Again this was what I considered best for my area. Obviously ground speed will vary but I do 140 Kt true at cruise.

> What is voice alert?

It's the "3rd and 4th band" in your APRS dual band radio.

See www.aprs.org/VoiceAlert3.html

It gets triple use out of the data channel by making all APRS mobile operators available for a VOICE call on the national channel they are already tuned to!

1) Instead of turning the volume down on the APRS data channel and wasting a perfectly good radio, set CTCSS 100 instead. This way you will get silence and not hear any packets, BUT you can be called by anyone using TONE 100. When calling someone, you MUST always announce "voice alert" otherwise the called party will hear you, but not realize you came in on an otherwise silent channel... He will respond with his PTT on whatever his band B is tuned to and communicaitons will fail. You MUST always say "calling on Voice Alert" to give him a clue that he must switch his PTT to the data channel to respond and receommended a QSY frequency for the QSO

2) Now then.. Once you have set CTCSS 100 on the data channel y ou will have silence. BUT, you WILL HEAR the original (not digipeated) packet of any other Voice Alert mobile that is nearby. Thus, you have a "radar detector" for simlex range of any other local APRS operators also with Voice Alert. It is a great way to meet people on the open road.

3) YOU MUST NEVER CONFIGURE VOICE ALERT FOR FIXED STATIONS!!!!!!!!! Doing so will "spoil" the area. There is nothing that will kill voice alert faster than some clueless individual that sets it on his home station... This irritates every mobile that drives throught the area, because they HEAR this home station's packets (which is in essence a HUMAN CQ for a voice contact" yet when you call him, he is not there 99% of the time. Therefore the mobiles soon learn of this SPOLIED are and will turn off their Voice Alert when passing through, and will forget to turn it back up when they clear this area of the nuisance operator. Then they do miss future voice alerts beacuews there is nothing to remind them that they turned Voice Alert down.

4) The above paragraph applies to home stations because most rigs cannot set CTCSS on receive without also setting TONE 100 on transmit, and we do not ever want to hear a single packet with TONE 100 unless there is a HUMAN operator listening.

Sorry Bob,

I started out using WIDE2-1 on my flights and found that did not work. I added the WIDE1-1 and found that worked at lease for my area.

Do you hear their voice, or just the packet and then use the APRS freq to call them on voice?

thanks,
Tom

Bob,
Have I thanked you for putting this little thing called APRS together?
It is my favorite activity. Thank you! Ohhh....and......I'll turn
Voice Alert off on my fixed station from now on when I leave the
shack......didn't know....

Topic: 6367 Message: 6377

Fred,

As a digi/IGate operator, I appreciate people like you! Acknowledging the infrastructure put in place by volunteers for all of us to use while traveling is a great idea! I've actually taken to sending a short thank you message via APRS to the local Digi/Igate whenever I stop for a break while traveling. I even got a LIVE reply once!

If you'd like to see a map of the digis and IGates you "contacted" on your trip, check out the maps at:

http://ldeffenb.dnsalias.net.nyud.net/Tracking/Requests/N7FMH-9*

I plotted each individual day from the 13th through the 19th as well as a composite for the entire trip. You might start at:

http://ldeffenb.dnsalias.net.nyud.net/Tracking/Requests/N7FMH-9-2009-07-13T00.00-2009-07-20T11.30-6.png

And browse around from there. The timestamps are the start and stop times, and the final dash number is the zoom factor. The larger zooms are quite large, so be patient and zoom in to see the details. The images that end in ...-D-n focus on the source points and may cut off the surrounding infrastructure.

Feel free to use these images however you see fit, but please republish the pictures, and not the links.

> from now on when I leave the
> shack......didn't know....

Yes, that is problematic. Actually it is not quite as bad as I made it sound if it is a fixed station, because then the rate is so low (1 every 30 minutes) that the probability of a mobile being in 3 miles simplex range is small... BUT hearing a voice alert packet is so rare, it is EXCITING and gets you all excited about being able to talk to someone...

So even one false alarm a day gets irritating when it is always in the same area.

What is really frustrating is a parked mobile with the rig left on Voice Alert... OR a voice alert mobile with his volume turned down... He comes BRAPPING into your simplex range effectively yelling CQ CQ every minute or so, and yet cannot hear your callback...

Oh well.
Spread the word.

There is no such thing as APRS for non-hams. It is APRS which is
reporting your satelitte location through ham radio or it is just
mobile satellite tracking.

Finally? No, that would have been www.mologogo.com here in the US at least five years ago. Their problem is that their system only uses Nextel prepaid phones ($10 month for all the data you can eat) which have a limited service area. But, five years ago, those were about the only phones sold in the US market that had full GPS devices onboard them. (As opposed to agps or locked out gps.)

"Two guys in a basement" syndrome, but the product has been out there, performing, and free to all except for the phone's charges. The amazing thing is that no one else has tried to compete with it before.

Didn't sound negative to me. Asking about APRS for non-hams is like asking for 2 meter user rights for non licensed individuals. The license is there to help protect our hobby.

6383. Re: [APRS] Re: APRS on flight to Oshkosh

Yahoo group: APRS (2007 — 2010)
Date: 2009-07-20 20:15:46 UTC
From: Lynn W. Deffenbaugh (Mr)
Topic: 6365 Message: 6383

Larry,

I just generated an APRS usage graph for K7YBZ-4 for all activity from
July 6th through this afternoon and posted them to:

http://ldeffenb.dnsalias.net.nyud.net/Tracking/Airplanes/K7YBZ-4*

It appears that there's only one flight in those two seeks, but it shows
that you really do have good coverage directly to IGates. If you zoom
in to

http://ldeffenb.dnsalias.net.nyud.net/Tracking/Airplanes/K7YBZ-4-2009-07-06T00.00-2009-07-20T14.00-8.png

you'll see that. Smaller red circles are Digis, larger red circles are
IGates. The black dots are your beacon positions. Green lines between
red dots are Digi to IGate communications. These graphs are generated
from APRS-IS data, so only the FIRST packet to be gated is graphed.
There is no indication of how many additional packets were flying around.

The point of my post is that very few (I'd guess less than 5%) of your
beacons went through a digi, but went directly to an IGate. I'm sure
lots of digis heard it and repeated it causing lots of copies to hit the
gates, but the first one is normally the direct one. WIDE1-1 certainly
doesn't seem to be needed unless you're trying to make sure you're
making it to a gate when flying extremely low altitude or on the ground.

With a WIDE2-1, if your beacon doesn't get directly to an IGate, it's
likely to get picked up by a WIDE2 digi. With that single repeat, you'll
almost certainly get to an IGate in most areas of the country. WIDE1
digis are really good at boosting ground-level signals to read the WIDE2
digis, but your plane's altitude lets you hit the WIDE2s directly.

If you are interested, I can add your callsign to my nightly batch run
to generate daily graphs like this that you can access the next day. If
you've got any upcoming flights, you can experiment with WIDE1-1,WIDE2-1
vs WIDE2-1 and see what the coverage does. Especially if you're doing
an out-and-back via different parallel routes and can change your path
at the outermost point.

Let me know and I'll enable the daily run and provide you the URL to
view the results.

In the meantime, let's all enjoy the hobby, try to learn as much as we
can, and apply it when we need to!

Lynn (D) - KJ4ERJ - ARPS Infrastructure Visualization

PS. Feel free to copy and republish these images, but don't publish the
links. The final dash number is the zoom factor. The larger the zoom,
the higher the resolution. You have to zoom in on some of these to see
the details.

Lynn,

It really depends on the phase of the moon, the twich in my thumb, and several other unrelated factors. There are several flights for which there is no data since nothing made it to an Igate. Since July 5, there have been eight flights. Two on the 7th, one on the 10th, one on the 12th, two on the 14th, and two on th 17th, and one on the 19th. I could see the OT2/VXA-700 did beacon/xmit with a good GPS signal. I always set and lock the xcvr on the ground before the flight. Even then I check to make sure the xcvr is on frequency during flight.

For whatever reason, the links you have posted below give me an error "HTTP 500, Internal Server Error" in the web browser.

I did re-read my original post and even after proof reading I see there is an error. I said I was using WIDE1-1, and then WIDE2-1. I did mean I started using WIDE2-1 and then began using WIDE1-1, WIDE2-1. I did notice aprs.fi shows WIDE1-1, WIDE2-2. It turns out that is what I have in profile 2 on the OT2. There should not have been any profile switching going on. All the other settings were the same in both profiles. I will deal with that later.

Thanks,
Larry
K7YBZ

Lynn,

I retried looking at the data you linked me to and this time it showed up. I agree with your conclusion, but I still would like to find the reason why the other flights did not get through at all.
Part of the reason may be that the antenna is on top of the fuselage rather than the bottom. Another is that four flights were at a lower altitude, between 1500 and 2500 ft.

I did find the problem with profile switching and for the moment have reprogrammed the path for WIDE2-1. I am returning to WA tomorrow afternoon so will see what happens.

Thanks for the clarification, Bob. And thanks to the others who have chimed in with "real world" experience from the air.

It may boil down to what "at altitude" means.

We will be a VFR flight, hoping to get up to 8500 or so westbound, and 9500 or so eastbound. That will only be available to us if the ceiling allows. Otherwise, we may be flying the majority of our time at far lower altitudes, and depending on terrain we may not be flying at all on a given day.

All things being equal, though, even 3500' should give us really good range, so I'll happily adopt Bob's suggestion and reconfig my unit for WIDE2-1. One of the possible paths carries us over northern Ontario, where I suspect the digi/gate coverage is nowhere near as good as it will be in the northeast and midwest US. So actual path may determine what I think I should try. Of course in sparsley populated areas there's little chance I'll get a digi and NOT get an iGate from up in the sky, so it may not make any difference.

If I am over the US I will not have the ability to monitor the success of my packets in real time, however if over Canada I will have my Blackberry on and browsing the APRS site(s) as we go, so I can determine the success of my packets getting gated.

As for where I read that WIDE1-1 was recommended, I'll have to check my bookmarks on my other computer where I did the majority of my reading.

I'm glad I asked for clarification before departure, and now we're set up. If the weather would cooperate now, we'd be good to go. Right now it looks like a Thursday departure, and we have opened up another possible path between weather systems, through southern Quebec and Ontario to cross in the Detroit area late Thursday or Friday, with planned arrival at Oshkosh on Sunday.

Please no. And if you can remember where you saw such information, let us know. It is wrong.

WIDE1-1 is never to be used at altitude. It brings up every single WIDE1-1 completely opposite of the intent of a WIDE1-1 digi. WIDE1-1's are for fill in and are not supposed to respond to anything but a local signal needing some help.

Doing WIDE1-1 from altitude, or anywhere other than the first hop in a path (the same thing) unnecessarily adds QRM to the network.

Now if you only want one-hop, that is what you are after... Use WIDE2-1 which will give you the same thing but not bring up all those unwanted WIDE1-1 digi's.

Help us stamp out old/bad information. If you know where you got that receommendation, let's get it changed.

If you are interested in being seen when you land or if you land in a soy bean field, then It would not be u nreasonable to fly with a path of WIDE2-2. This will improve your probability of getting to an Igate once you are on the ground.

And there is no more QRM from WIDE2-2 than from WIDE2-1, because in either case, EVERY digi within 100 miles is going to hear you on the first packet, and they will all digipeat on that first packet, and then since all of them have already digipeated the packet, then they will not further digipeat it the second time.

This is the same recomemendtion for balloons. Because you need to find them on the groiund, so you need the second hop. But at altitude, there will be no second hops in most cases, again, because all digis heard it the first time.

Of course there will be some digi's that were hearing someone else at the time and so they may have missed the first hop, but they will then pickup on the second hop. But that is the design of the system. Whether the path is WIDE2-1 or WIDE2-2, EVERY digi will digipeat the packet once and only once. So the QRM level is insignificantly different for APRS devices at altitude. Your 2 minute rate is a nice thing to do, to keep the network load down.

THE MOST IMPORTANT thing at altitude is to set your DCD to OFF or set your squelch very tight (MAX). If you set a weak squelch, then the chance that your APRS device will ever hear silence is very small.

"BUT hearing a voice alert packet is so rare, it is EXCITING and gets you all excited about being able to talk to someone..."

So true! It was exciting! You should try it! I only listened as an experiment and now I have to reconfigure the APRS radio (reprogram PROM). I imagine that if I was transmitting a tone as well, I might have made another contact or more.

Keep the ideas coming Bob!

Best regards,
Fred

Hi Lynn,

Every time I see your generated maps I am impressed at how far the packets get sent occasionally. I noticed there was one hop all the way from WV to just south of Cleveland Ohio. I really makes it obvious that the correct settings need to be used! Of course the hop into K8YSE I-gate throughKB8CVP-7 was probably due to sporadic E.

I have sent a few messages and have seen occasional response. Mostly I see the responses online. My message system doesn't store old messages yet: it needs a software modification. I can only see the most current. :(

I run a fill-in at home and I enjoy seeing it actually doing what it was intended to do. I don't see it as a station on any maps though. I am curious as to why.

The Voice Alert contact was on the map as well. I am thinking he was running a digi from the campsite.

Thanks for the maps!

Best regards,
Fred

Mods, if this is not allowed, please fell free to delete it:

I just traded for this and I was going to keep it but I already have so much APRS stuff.
Kenwood TH-D7A(G ver.2,0), with New Battery, used battery and AA battery case. Programming cable with a CD with Kenwood's programming software and Link700.
Hockey puck style GPS
HP Jornada Handheld computer, running Windows CE and APRS-CE.
All cords, manuals and a carry bag to carry it all with you.

Just add your callsign and it is ready to go.

$400 or trade for?

Please call Steve @ 309-371-0540

Fred,

The TT4 that is my fill-in digi/IGate also doesn't show up on the maps
and I think I finally figured out why. It is beaconing telemetry
(battery voltage) but has not beaconed a position for a LONG time. It
feeds KISS through to javAPRSsrvr running the Digi/IGate (I don't use
the TT4 digi capability) as KJ4ERJ-2. That one shows up on the map
because I have configured coordinates in it. I'm still trying to get
one of those round TUIT thingies to take the TT4 offline and set up a 30
or 60 minute beacon of position.

If it is a network asset used by others, then we think it should send out its beacon once every 10 minutes direct so that anyone that comes in range has no more than a 10 minute latency to finding out the network around him.

I havent looked. But is there a way to do proportional pathing as well, so that at least one of those beacons goes out 1 hop at maybe once an hour?

Actually, I missed adding the appropriate SSIDs. The TT4 is KJ4ERJ-7
and is simply the RF interface for the javAPRSsrvr Digi/IGate which is
KJ4ERJ-2. KJ4ERJ-2 is the network asset and does beacon it's position,
along with PHG info which is interpreted by aprs.fi as "power 4W,
antenna HAAT 20 ft, gain 2 dBi omni, range 4.7 miles". I need to get
the WIDE1-1 Digi status in there as well, now that I've looked at more
and more of the APRS documentation.

As for proportional pathing, I'm not sure. I'll have to dig through the
TT4 and/or javAPRSsrvr documentation to figure that one out.

From: P. Suryono Adisoemarta
Topic: 6395 Message: 6395

I have a friend that just received a FoxDigi and asked me the proper setup as APRS digi. The question is: can FoxDigi act as a WIDEn-N APRS digipeater?

Quickly poking on the manual, it seems this device is a regular packet radio TNC/digi that for APRS can only do a single, non-decrementing alias, such as WIDE1-1.

Let me know if my observation is incorrect, and please point me to set it up properly for max 2 hops setup.

As I recall the FoxDigi will support any path however in my opinion the performance will be very poor. Here is why. As compared to a Kantronix or Paccomm tnc it takes a full quieting signal with absolutely no noise for it to decode the packets. I ran a test using a service monitor and it took about 1.5 micro volts of signal to decode. The Kantronix and Paccomm would decode at .5 micro volts on the same receiver.

> volts on the same receiver.

For what its worth, that is almost 10 dB of performance, or
1/3rd the range.

As another data point on a different combination, we have used
the Kenwoods for a lot of our projects and have measured them
down to about -117 dBm for 90% decodability and that equates to
about .31 uV, which is about another 4 dB improvement.

For consistent performance, that is why we are using the D700's
this weekend for the Appalachian Trail golden packet attempt.
Every radio/TNC combo is the same. So we know what we are
getting. Watching MOST of the signals on 144.39 and it is
abysimal. Some of them need 20 dB stronger signals to decode.

People just plug-n-play their TNC/Radio and say "it works".
When in fact, they might have 20 dB of performanc loss even
though they can still hear the digi 10 miles away...

I'd love for someone to build a black box that we can use to
monitor 144.39 which will send back a message saying "your
signal sucks"... or some such relative performance assessment...

If it is like a Kantronics type then you could put it into KISS mode and then connect it to a computer. Then you could pick any number of softwear options that are able to run WIDEn-N plus a whole host of other options. If you had an internet connection nearby you could also run it as an IGate.

I ran a test using a service monitor and it took about 1.5 micro volts of signal to decode. The Kantronix and Paccomm would decode at .5 micro volts on the same receiver.

Depends on what you're calling APRS. If you're talking only about the protocol, then yes, anyone can use it. Some restrictions to keep in mind:

The name APRS is a trademark of Bob Bruninga, WB4APR. You can't use that name in trade without his approval.

The APRS specification document is copyrighted. You can't distribute copies without permission. This does NOT mean you can't use the protocol described in the document. Copyright law has been very clear on this for at least a century.

APRSdos and various other APRS clients include licensing terms that restrict or prohibit their commercial use. Others, like Xastir, are unrestricted.

> unrestricted.

Unrestricted for commercial use, yes. Unless you consider having to give out the source code a restriction! hi hi. Xastir is under the GPL license which requires making the sources available.

Scott nailed everything pretty much on the head. If you want to use the term "APRS" in the name or description of your program you need to get a license from Bob Bruninga to do so, although Scott's lingo may provide a way out if you're only giving the program away for free. Research that bit before relying on our opinions. I hadn't thought about that angle before.

It's worth asking Bob if you're considering coming out with a new application, the terms may be quite reasonable! Having "APRS" in the title and/or description lets users know what it is, while working around NOT using it is a pain. We did that for a while with the Xastir project.

Hi Peter
According to the PacComm Tiny-2 manual KISs ON\OFF or
Y|N Default OFF

On - RESTART command initiates KISS firmware

OFF- RESTART command reinitiates standard packet firmware

Hope this helps

Rich
one of the local qangos? has expressed an interest in using it for their own purposes. They would not be using the APRS-IS or anything like UI-view. They have their own frequencies and technical organization.

So what else is affected?

See: www.aprs.org/APRS-by-Bob-j.ppt

Please do not present APRS as a vehicle tracking system using one-way trackers. That is a missrepresentation.

APRS is a two-way network providing digital info direct to mobile's heads-up displays and all other operators to support local communications and help reduce congestion on voice channels. The key value of Ham Radio operators is their ability to communicate (2-way) in a flexible manner. APRS provides a back-channel for the broad exchange of locally relevant real-time information to all parties.

To me, having a ham in a vehicle who cannot receive, display, or read the rich source of relevant information found on the APRS channel is a waste of assets. And prior to an event or during call-up, APRS provides that single signalling channel to identify, locate, and page all available opertors instantly, no matter what voice frequency they are monitoring.

In addition, Ham Operators can bring tracking devices for use at events where there are not enough hams to cover all moving assets.

Something like that. I am not anti-tracker. Every ham should have a few trackers to contribute during an event for special objects, but as a ham, the one in his vehicle should be 2-way, so that he can be reached.

Bob, WB4APR

Thank you, Bob! That is an awesome P/P presentation. The good thing is that I've pretty much made most of these points in my more simplistic approach.

Our local ham club unfortunately is very focused on only DXing and contesting. A lot of the fellows are older and to try to get them to look at new technology is difficult. It is my opinion that this is why our membership has dropped significantly in the past few years. There is nothing for young people to look at and say "Wow look at this technology!" So when a friend and I were asked to give this presentation we were very excited. We are hoping to entice a few of them to try APRS and focusing on the vast amount of info available.

With your permission, I might want to "borrow" a couple of your slides if that is OK.

I've built at lot of pocket trackers over the years and experimented with UIView, a D700 and D7g. But driving around with an AvMap and D710 is amazing!

The most important point I am going to try to impress is the "voice alert" capability that anyone can do even w/o beaconing. On a trip to WV recntly it was nice to hook up with other hams while driving. I wish more would try it.

Anyway, I will upload my P/P presentation an a couple of weeks for comments and corrections.

Thanks again,
73

From: Tapr Digital
Topic: 6418 Message: 6418

TAPR has been ham radio's preeminent digital voice & data technology group for over 25 years.

TAPR was a pioneer in developing packet radio technology and most recently has been a leader in the development of SDR (Software Defined Radios).

TAPR promotes the development & use of digital voice & data technologies through several means:

- TAPR Publications, www.tapr.org/publications, including:
  1) PSR, Quarterly Journal, www.tapr.org/psr
  2) DCC Proceedings, www.tapr..org/pub_dcc27.html

- TAPR Events
  1) Annual DCC (Digital Communications Conference), www.tapr.org/dcc
  2) Dayton Hamvention TAPR Forum & Banquet, www.tapr.org/dayton

The ARR/TAPR DCC (Digital Communications Conference) will again be in the Chicago area on September 25 - 27. The DCC offers both Technical & Introductory presentations. TAPR welcomes the submission of both technical papers & presentations for the DCC covering all digital voice & data technologies.

TAPR also has a number of Kits, www.tapr.org/kits, Software, www.tapr.org/software, and Products, www.tapr.org/productsavailable.

You you can join TAPR at www.tapr.org/organization.html#membership

You can now learn about TAPR's activities & developments throughout the year by following TAPR on Twitter at http://twitter.com/taprdigital

In the meantime, you can reach TAPR at http://www.tapr.org/contact_us.html

Topic: 6420 Message: 6421

Phillip,

I've considered a geocaching query server, bur the issue I keep running into in my mental planning is getting access to the original cache data. Geocaching.com has severe restrictions on what you're allowed to do with their GPX and LOC files. Also, coordinates only down to the hundredths of minutes (instead of thousandths) (unless you add the |DAO| APRS extension), you're going to have a much broader search area than you're used to.

I was thinking of an APRS query service where you ask for the closest N geocaches and it would send them back as Item in Message format, but then I've learned that not a single known client implements that feature, so they'd have to be normal objects. But normal objects don't gate from -IS back to RF without a local IGate operator knowing in advance.

APRS can provide the starting piece of the puzzle, getting your coordinates to a query server, but getting the caches, and getting the coordinates back to you in a digitally usable form with high enough accuracy are the two issues I haven't overcome yet.

Instead, I'm hoping to add GPX/LOC support directly in my APRSISCE client for Windows Mobile. You drop your own GPX/LOC onto your phone and the local client will put them on the screen as clickable objects for your personal use. You get the GPX/LOC using your own geocaching.com logon and put it on your own device for use, no license issues there.

I'll entertain any other ideas if you've got them. I've got the development capability on this end as well as access to APRS-IS.

Lynn (D) - KJ4ERJ - Author of APRSISCE for Windows Mobile

APRS just like PSK31 utilizes ham radio frequencies and innovation.

Tell me where your daughter is when the tornado blows through your town and knocks down the NEXTEL tower. I bet you could find her with a ham radio operator running a digi-peater in the next town over.

If we start letting APRS for the masses it will no longer be our frequencies. It will be CB breaker 144.39!

Finally? No, that would have been www.mologogo.com here in the US at least five years ago. Their problem is that their system only uses Nextel prepaid phones ($10 month for all the data you can eat) which have a limited service area. But, five years ago, those were about the only phones sold in the US market that had full GPS devices onboard them. (As opposed to agps or locked out gps.)

"Two guys in a basement" syndrome, but the product has been out there, performing, and free to all except for the phone's charges. The amazing thing is that no one else has tried to compete with it before.

From: Phillip
Topic: 6420 Message: 6423

Hi Lynn,
Many thanks for the reply

Yes I realise that there are certain things you can and can't
do with geocaching as it is
licensed etc ..Shame

But APRS and UI-View / AGW / and other programs could have a similar type
thing that can be worked into
what we have now I am sure

UI-View has the grid square overlay embedded with and I was looking at this
as a starting point .
Grid square chasing ??

As I said programming is not my pie I just wanted to get something out here
to make users etc aware that
we could use APRS for a similar thing..

I do hope some-one can come up with some thing

I am sure many will be watching

73 Phillip

Subject: Re: [APRS] APRS geocaching ?

Phillip,

I've considered a geocaching query server, bur the issue I keep running
into in my mental planning is getting access to the original cache
data. Geocaching.com has severe restrictions on what you're allowed to
do with their GPX and LOC files. Also, coordinates only down to the
hundredths of minutes (instead of thousandths) (unless you add the |DAO|
APRS extension), you're going to have a much broader search area than
you're used to.

I was thinking of an APRS query service where you ask for the closest N
geocaches and it would send them back as Item in Message format, but
then I've learned that not a single known client implements that
feature, so they'd have to be normal objects. But normal objects don't
gate from -IS back to RF without a local IGate operator knowing in advance.

APRS can provide the starting piece of the puzzle, getting your coordinates to a query server, but getting the caches, and getting the coordinates back to you in a digitally usable form with high enough accuracy are the two issues I haven't overcome yet.

Instead, I'm hoping to add GPX/LOC support directly in my APRSISCE client for Windows Mobile. You drop your own GPX/LOC onto your phone and the local client will put them on the screen as clickable objects for your personal use. You get the GPX/LOC using your own geocaching.com logon and put it on your own device for use, no license issues there.

I'll entertain any other ideas if you've got them. I've got the development capability on this end as well as access to APRS-IS.

Lynn (D) - KJ4ERJ - Author of APRSISCE for Windows Mobile

From: Rev Robert J Spencer
Topic: 6424 Message: 6424

Ok everyone I have just upgraded the lap top. I loaded everything in order and rebooted each time. Done this install more then I wish to admitt to. However when I try to open the pm7server 7 from the zip I get the following. "the version of this file is not compatable with the version of Windows you're running. Check your computer's system information to see whether you need an x86 (32-bit) or x64 (64-bit) version of the program, and then contact the software publisher."
What needs to be changed first attempt with Vista.

6425. PMapserver7 & windows Vista Home Premium 64 bit version

PMAPSERVER7 & WINDOWS VISTA HOME PREMIUM 64 BIT VERSION

Ok everyone I have just upgraded the lap top. I loaded everything in order and rebooted each time. Done this install more then I wish to admitt to. However when I try to open the pm7server 7 from the zip I get the following. "the version of this file is not compatable with the version of Windows you're running. Check your computer's system information to see whether you need an x86(32-bit) or x64 (64-bit) version of the program, and then contact the software publisher."

This is a 64 bit version of Vista. What needs to be changed or done to get this APRS system back up. This is my first attempt with the Vista program.

Try running the program in compatibility mode. If you have an icon on the desktop, right click on the icon and from the menu select 'properties'. One of the tabs should be 'Compatibility'. Under the 'Compatibility mode' box, select 'Run this program in compatibility mode for: Windows XP (service Pack 2).

You might have other selections besides XP which might be more appropriate.

If you don't have an icon on the desktop, then select 'Start' and look for the program. Right click on the program and select 'Properties' and follow the above instructions.

deluo electronics - does anyone know the status? The web site is down (all I get is "Could not connect to SQL db") - looking to purchase GPS. It was up a week ago.

http://www.deluoelectronics.com/category/1-GPS_Receivers

I guess I will go to bionics? As they have similar "stuff" http://www.byonics.com/cables/byonics_gps.php - need adapter for Kenwood D710a.

Comments?

Deluo is toast. Scott Miller N1VG actually paid a guy in FL a few bucks to drop by their place and check on them. He reported the place was empty and closed up. I wasn't surprised after both my contact (sales guy) and the president both left the company in a hurry. Not sure what happend there, but they were both gone fast.

I am currently talking with an overseas supplier to start carrying a similar GPS with the popular DB9 "tracker pinout", but I don't have anything set it stone just yet. I know Deluo's Mini-Din adapter scheme was popular, but I am not that interested in playing fill-in for that market.

I think, after looking around at GPS's, that a DB-9 connector is more functional as it can be adapted for a mobile rig and work without modification with the trackers on the market. The mini-DIN would need to be adapted for the mobile rig, anyway. Sine I have a bunch of old rigs, a tracker would make nice use of them. Sorry to hear someone got hurt when Deluo went "south".

6439. New Illinois Packet Radio Group

Yahoo group: APRS (2007 — 2010)
Date: 2009-08-08 07:43:08 UTC
From: Mark Thompson
Topic: 6439 Message: 6439

Over the last couple years there has been a resurgence in interest & activity in packet radio.
The interest is not in creating the former BBSes & networks of the 1990s, but instead in doing things packet radio is uniquely good at.

Packet radio's resurgence started with the new application, APRS which uses packet radio. In some areas the application
DX PacketCluster provides access via packet. More recently applications like Output & Winlink are making use of packet radio.

As is indicated in the attached email, Illinois ARES is planning to implement the Winlink application state-wide using packet radio for user access.
However, the Illinois ARES Digital Working Group is apparently more focused on the ARES implementation of Winlink and
is not the appropriate forum for general discussion of packet radio or other digital modes.

So I have created a new group, Illinois Packet Radio. The focus of the group will be to discuss packet radio usage in Illinois
including applications using packet radio, such as APRS, Outpost, Winlink, DX PacketCluster, etc.

We hope to also create a database of packet radio usage in the state.

The Illinois Packet Radio group is available at:
http://groups.yahoo.com/group/IllinoisPacketRadio/

Look foward to your participation in the group.

Thanks.

73, Mark, WB9QZB

By the way, the Illinois D-STAR yahoo group, is also available at:
http://groups.yahoo.com/group/IllinoisD-STAR

----- Forwarded Message ----
From: Brad Pioveson W9FX <w9fx@...>
To: IL_ARES_DWG@yahoogroups.com; Illinois_ARES@yahoogroups.com
Sent: Wednesday, August 5, 2009 7:30:18 AM
Subject: [IL_ARES_DWG] Once again. . .

With apologies for the dual reflector post, it is important that this message get out to all concerned.

Regarding the Illinois ARES Digital Communications Network initiative:
Let's go through the motions one more time. I have been
given to understand that there are those who have misunderstood the recent efforts to develop a digital EMCOMM system for Illinois.

Here are the facts, plain and simple:

The effort underway is to develop an Illinois ARES digital communications network. Note the acronym - ARES. That acronym refers to the Amateur Radio Emergency Service. That third word is the operative term in the phrase. This will be an emergency digital communications system. This effort is neither intended to supplant, extend, nor change the frequency of operation of any existing digital activity anywhere in this state (or, bordering states). We are neither trying to usurp nor hinder a resource for DX packet cluster users, nor are we trying to provide a digital outlet for those without high-speed Internet systems to obtain their daily dose of email. The network we are building is for the expressed purpose of providing a digital conduit by which emergency communications traffic - data - can be moved between any two points in Illinois.

This network will be on a discrete frequency. This frequency is far from any of the current packet radio activity of which I am aware in the state of Illinois. The frequency assignment we have been handed can be found in the IRA's 2006 document, available online, at http://www.ilra.net:80/Band-Plan-2006.html If you take the time to follow the link, you'll see '145.610 ARES Statewide Packet.' I didn't attend the meeting that preceded that publication, and, it is not
an issue for me. As far as I'm concerned, it's as suitable a frequency for our purposes as any other, and, it meets the criterion of being well removed from 145.01, 145.05, 144.39 and 147.555. Users of those particular frequencies need not worry about interference from the ARES network.

We're not looking to develop a system of BBS's. We're not looking to move routine email around the state. We are not putting a network together to facilitate classified ham ads or hamfest announcements. We are developing an emergency digital communications system. We hope that it will be used enough on a weekly or daily basis to ensure that the network operates properly, but, again, we're not building a replacement for the Internet.

This network will offer 1200 baud VHF packet radio connectivity as a minimum standard. If node operators (RMS Packet/Relay stations) have 9600 baud capabilties, so much the better. But, 1200 baud is the least common denominator. Joe Ham can get on 1200 baud packet radio with any 2 meter FM rig and a sound card equipped PC running AGWPE TNC-emulation software. It isn't the prettiest lash up, and, certainly not the most efficient, but, it will work, and, that gives us our starting point and minimum standard.

The network will operate using Winlink 2000 RMS Packet/RMS Relay software and the current iteration of UIView software. These can be run simultaneously on a Windows XP/Vista platform using AGWPE software running concurrently. I understand that RMS Packet/Relay and APRS applications can also be run under the Linux OS.

Individuals will use client software suitable for use with the Winlink 2000 and APRS servers. Client software for messaging with the Winlink systems can be either Airmail or Paclink. Those are the only two client appications that are currently supported, to the best of my knowledge, but, I am not a Winlink guru and cannot speak with authority to that issue. I defer to the

APRS crowd as to what soft/hard-ware applications are currently in vogue for use with that system.

RMS Packet, RMS Relay, Airmail, Packlink, AGWPE and UIView32 are all free software applications.

Will this network be state of the art? Not likely - we're using existing technology and assets; some of the hardware has been around for a couple of decades, in fact. 1200 baud is a slow crawl compared to modern Internet broadband connections. Even 56k dial-up connection speeds leave 1200 baud in the dust. But, we're talking about an emergency communications system - a 'when all else HAS failed' system. And, compared to voice or CW, 1200 baud is pretty speedy.

6446. Problem Receiving Packets

Yahoo group: APRS (2007 — 2010)
Date: 2009-08-10 18:00:45 UTC
From: Rob Erikson KG4OPX
Topic: 6446 Message: 6446

I was using a sloppy homemade cable between my Kantronics KAM and my ICOM-207 radio. I purchased the appropriate cable from BUXCOMM.

I am having problems with the KVMDIN cable they sent me. As soon as I plug the end with the 6 PIN into the back of my ICOM 207H I get noise like the squelch is wide open. I cannot get rid of the noise. I can transmit but I am not seeing the received packets in UI-View. The noise drowns out the packets. I have my KAM config with CD SOFT. I have a KPC 3+ that is behaving the same way.

I was just going to suggest putting a ferrite on the cable between the TNC and the radio. Another source of noise is when the TNC is on a Y cable which supplies power to both the TNC and the radio.

There is also some mumblings in the manual for the 207 to keep the audio level adjusted properly and the manual also has the SQ pin connected in their wiring diagram. The Buxcom cable does not appear (bad resolution) to have the SQ wired through. I can only see Audio in, Audio out, PTT, and GND connected besides the connector shells.

Also note, the manual says to remove the microphone from the radio when using 1200 BPS mode. By default the radio is supposed to be in 1200 BPS mode, but you should double check.

6449. MFJ 1270B Question

Yahoo group: APRS (2007 — 2010)
Date: 2009-08-11 00:59:09 UTC
From: rrath
Topic: 6449 Message: 6449

I just acquired the MFJ 1270B tnc. My questions are:

1. Has anyone used this unit on HF with the Icom 706mkllg?

2. I opened the cover to inspect it and noticed that the IC in u24 is missing. Does that mean this unit is a paper weight or can I still buy the missing IC even as old as this unit is?

Thank you for your answers ahead of receiving them. Feel free to answer off site (direct to me) as these answers would not be of any help to anyone but myself. Thank you.

Hi,

Im looking at a APRS project for a remote monitoring voltage and current of a small remote solar power system for my weekender cabin

looking for a design using a PIC/ATMEL micro with A to D converter to measure analouge voltage and current, then send a beacon with the data to a APRS gateway then able to monitor from my PC

Have seen Weather APRS trackers but not much for analouge telemerty APRS trackers

Frank,

Take a look at the Byonics TT4 or its cousin, the Micro-Trak TT4 with a built in transceiver. They have multiple telemetry inputs.

The OpenTracker+ will report its supply voltage, temperature, and at least one external ADC input without any modification. If you want to tweak some C code, you can customize it to do whatever you need.

One thing to consider If you want to take advangtage of the telemetry archivers and plotters built-into most of the APRS-IS on-line data systems, consider using a system that outputs in the standard APRS telemetry format. As an example use the Telemetry CGI on FINDU.COM to get a plot of data from any APRS telemetry source for any time over any period. FOr exmple, see this web page which calls the FINDU.COM telemetry CGI:

www.aprs.org/wb4apr-15.html

Look at the source for that web page and all it is is a list of calls to FINDU.COM.

WB4APR-15 is a KPC-3 TNC in the attic of my aged parents home in Alabama, so I can monitor conditions when I am not there.

Isn't that a 1200 baud only TNC? If so, then the answer is no.

You need a TNC that does 300 baud and has all of the HF filtering
built-in.

No, what you're adjusting is the serial port data rate between the
TNC and the computer...

What you need for HF are sharp filters around the two tones and 300
baud data rate out the radio with different shift than is used for
1200 baud. The filters are VERY important for HF as are the data
rate and the shift. This requires a TNC that was built with HF
capabilities when manufactured. Something like a Kantronics KAM or
an AEA PK-232 for instance.

The MFJ 1270B is made for hf and vhf. The manual
says it can do 1200 or 300 with the internal modem. I
plan to see what I can do with it this weekend. I will
need to make up all the cables as I do not have any.
Thank you for all your replies. I will keep you informed
on the progress.

6460. APRS Weather station via mobile phone

Yahoo group: APRS (2007 — 2010)
Date: 2009-08-13 13:41:51 UTC
From: jim_stuckinthemud
Topic: 6460 Message: 6460

I'm looking for a solution to connect a weather station to the internet via a mobile phone, without using a PC/Pocket PC.

This is to put on a weather station at a location where there is no RF APRS coverage, so need to use a mobile phone GPRS connection to pass the data to an APRS server.

Does anyone know of any interface that is capable of this?

Jim, G1HUL

if its connected to a PC just tether the phone to it.. a boost mobile phone would be a good way to do this as the data is only .35 per day.

Fred,

Here is a document for the D710 to help you get started with APRS, and for that matter, ECHOLINK with the D710A.

http://www.kenwood.com/i/products/info/amateur/pdf/TM-D710AE_IDM_R1.pdf

You will need a USB-to-SERIAL adapter and the data cables can either be made or purchsed. You can make the cables for 1/10 to 1/5 the cost of dedicated.

Neil -

Do you still have DRSI DPK-2 manual?
I could use a clean electronic scan OR a good paper copy.

6466. APRS Tracker Project

Yahoo group: APRS (2007 — 2010)
Date: 2009-08-17 02:05:47 UTC
From: Mark Crosbie - N8MNI
Topic: 6466 Message: 6466

I am planning to build an APRS self contained tracker in a plastic toolbox.
My current tracker set up, I am carrying this around in a Ziploc bag now for a couple years.
I want something that I can move from vehicle to vehicle easily.
This is similar to the Powerhouse Tracker.

I have the following equipment:
a.. Kenwood TH-75A HT
b.. Byonic's TT3+
c.. Mirage 30w 2m Amp
d.. 2 - 12v 12Ah Gel Cell Batteries
e.. digital Volt meter
f.. Black & Decker Plastic toolbox
g.. toggle switches
h.. external power pole connector
i.. external DB9 connector for GPS
j.. SO-239 for external antenna
k.. dual band 20" magnet mount antenna
l.. internal / off / external power switch
m.. LEDs for indicators
n.. 40mm 12v fan
o.. hand mic so unit could be used for FM Phone if needed
What would you suggest I add to this unit?
I may later upgrade to a mobile rig and remove the amp and HT.

You sure you need a fan? If you use a fan, I'd also suggest a thermal
switch to control the fan, no need to run it until it's needed. In fact,
I'd use 2 12v fans in series, one near the bottom, one near the top.
You won't need to use a lot of air, even if you're mobile and sending
out a position every 20 seconds or so, that's a duty cycle of 10%,
you may not need any fans at all.

And some kind of ground plane for the antenna. The best would be
a plate that you put a NMO or similar mount on the top of the box.

> What would you suggest I add to this [tracker] unit?

Add a Receiver permanently on some local repeater or calling channel that is always ON when the traker is on and who's frequency is announced in the text of all your posits.

With that, then you can at least be part of the 2-way APRS network and be contacted by the other nearby APRS operators.

Bob, WB4APR

From: nakitatrucker
Topic: 6470 Message: 6470

i just found out the closest place near me that is a digi for aprs is 120 miles away, there used to be one here in sheridan wy 82801 but it got shut down due to antenna problems. i was thinking of a TT4 but i know thats not a choice now because of the range. What about the Micro-Trak BFT, is 120 miles too far to ask out of any mobile tracker?
thanks,
K7CDL

Ron,

I am biased when it comes to products I manufacture, but I think that unless that digi is pretty high up, even a 35 Watt transmitter with a good antenna is a little optimistic for over-the-horizon transmissions. You can look at APRS.fi and see if people in your area are hitting it. How about one of our MT-TT4's and set up a digi and I-gate in your area? Sounds like a fill-in, or even high level digi could be just the ticket.

6473. What do you use for an APRS ID when operating in Canada?

Yahoo group: APRS (2007 — 2010)
Date: 2009-08-21 23:53:04 UTC
From: k7rbw
Topic: 6473 Message: 6473

As I understand it, if you're a US-licensed ham operating in Canada, you just prefix your US call with the appropriate Canadian call prefix. So, if I go to British Columbia, my call would be VE7/K7RBW.

Now, if I have an APRS tracker in the US, it's call might be K7RBW-14. If I take it into Canada, do I need to change it's call to VE7/K7RBW-14?

Thanks!

Whenever I see a Canadian APRS Station drive through my area (almost
daily) they are beaconing only their call. No extra info.When I lived
in International Falls, MN and if I was operating in Canada on voice
(No APRS for me at that time) we always used /VE3.

This is really an AX.25 question. I mention that because it will help clarify what I am going to describe.

The "from" call or MYCALL that you set your tracker to is an AX.25 defined callsign and SSID. That means that the callsign may be any combination of ASCII numbers and upper case ASCII letters (other characters may be used with varying degrees of success) totalling 6 characters. The SSID is 0 (usually not entered explicitly) through 15. So, VE7/K7RBW does not meet the callsign restrictions of AX.25 and therefore cannot be used.

So how do you meet the letter of the law? This was discussed a number of years ago about most all reciprical licensing agreements and the general agreement was to leave your AX.25 identification alone (use K7RBW-14) and put the reciprical licensing format in the packet data. This would mean putting VE7/K7RBW in your posit comment area (I don't know how your tracker calls this area, but it is where you put any generic comment or text). This ensures proper identification of your transmissions while staying within the confines of the AX.25 specification.

Summary: Don't change the basic tracker settings; add VE7/K7RBW to the text area of your posits.

Hope this helps.

73,

Pete AE5PL

Hi Bob

The intent of appending the regional prefix is to let other stations know that what they are receiving is local rather than DX. This is very common on HF and less common on higher frequencies. Many references say the same for Canadian hams operating in the US. As far as I know, it's intended as a courtesy but not a strict legal requirement. When it comes to APRS, everyone already knows exactly where you're transmitting from because of your position beacon so trying to appending a regional prefix is redundant. If you want to keep everyone perfectly happy you can always throw a "Sight seeing in British Columbia" in your status.

In short, you don't have to change anything. In case you're wondering you would still run on 144.390 and most of the digipeaters support WIDEn-n.

Bruce you hit it right on. That was also what I was told by a Canadian who was actually a RAC rep. No need to worry about the provincial extension for APRS. I did use the provincial extension while using a VHF repeater (IRLP) and on HF. It was kind of weird to change call signs ever other day or so going through the Maritimes and Quebec. And I did get a few welcome messages and responded whenever possible (not while driving the RV), resulting in one nice QSO .

Scott - Is this really your car? I see why you refer to it as a mobile station! You only have one picture of a Die-hard. If it is actually running all of this Sears would use you as advertisement! What does your power solution look like?

6488. GPS Units

Yahoo group: APRS (2007 — 2010)
Date: 2009-08-23 17:50:58 UTC
From: Jonathan Thawley
Topic: 6488 Message: 6488

To All:

I'm going to be purchasing a GPS this week. I was looking at the Garmin NUVI units, but I would rather purchase something that will allow me to use it for APRS operation as well. Any suggestions would greatly be appreciated before I take the $200.00 or so plunge...

You don't mention what sort of APRS devices you wish to connect it
to. If you have or are considering getting a Tracker2 or a T2-135
(that last fits inside an Alinco 2-meter mobile), then hurry up and
buy one of the Nuvi 350's while there are still a few available.
You might already be too late.

Radio Shack has refurbished units for $110 or so, web-purchase only,
delivered for free to a RS near you.

The 350 is the only one of the Nuvi's that when presented with
another waypoint the same as one it already has, moves it. All
others that I know of end up plotting both, so mobile APRS is a mess
with them.

Any NUVI with Fleet Management Interface can also do 2-way APRS
messaging through a Tracker2 or T2-135 also. See the Argentdata.com
side for details on which Nuvi provides which features when
connected with a Tracker2.

Of course just checking the site I'm not getting in right now...
The 350 is the one you want though if you can get it. Others are
less capable. The 350 is evidently out of production. If only
Garmin would make some small software tweaks in their current
models...

From: Jonathan Thawley
Topic: 6490 Message: 6490

I guess maybe I should have included more info in my request...

I will be using a computer either a laptop or a small form factor desktop installed in the vehicle.

I will be using a PK-232 TNC and I probably use an OLD Kenwood TK-250 Commercial HT that I have laying around here for the radio. I have a KAM+ that I plan on setting up at the home QTH to run a digi.

I do have a couple DeLorme' TripMate that I've been told you can use with some modifications... but it is my understanding that they only use 8 of the GPS satellites.

All the above being said... I'm not stuck on GARMIN... I'll buy whatever I need to to make it work.. I just wanted something portable with a touch screen that would work for APRS and also if i wanted to take it with me I could use it as well.

Thanks,
Jonathan/KC8CPW

I suspect the PK-232 is not going to suit your needs well. I don't think it has APRS built-in, unless perhaps TimeWave added that later on and you upgraded to their EPROM's ($$). In order to use it for APRS while mobile you'll probably have to put it in KISS mode and use an APRS program on the laptop all the time. This gets old fast. Too many cables, too much equipment, too much stuff that is visible and might get stolen out of your vehicle.

I'd recommend going with something like a Tracker2, a TinyTrak4, or if you really want to spend money a KPC-3+. Any of those will allow you to do tracking w/o the laptop, but then you can connect the laptop into the system when you decide you need it/want it.

If you go with the Tracker2 (or Alinco DR-135T + T2-135 board from ArgentData) and Nuvi-350 combo, you have most of APRS w/o having to connect in the laptop, but still have the option to do so.

Also consider running 10-20W for a mobile. You're talking about an HT which probably runs 1W to 5W? You'll most likely be disappointed in the track you produce. High power like 40-60W hurts others on the channel, while 10-20W seems to get you out nicely without stomping too much on others.

FWIW: I started out on commercial gear with a TinyTrak-1 and then TinyTrack-II's. Later I went to OpenTracker-1's and then Tracker2's.

I go with the ammo-can construction, so I have a mobile rig and a Tracker2 inside an ammo-can, with a RS Digitraveler hockeypuck GPS ($30 on closeout years ago) on the dash for my GPS. If I really want a laptop connected into the system I can open up the ammo-can and hook into a connector on the Tracker2. Someday I'll re-do the setup to have another DE-9 mounted on the outside of the case to make this connection.

So... There are cheap ways of doing what you're after, and most of the TNC's I mentioned in my last post will do KISS mode as well. Some may require reflashing the firmware. I think even the OT1+ can do KISS mode in this manner (again cheaper).

Interesting sign. However, it may backfire. How many times have you touched near a "Wet Paint" sign?
All of those antennas are connected except for one: There's a small antenna behind the K-40 CB antenna (yes, I'm active on CB sometimes (It can be very useful!)) which acts as a reflector to even out my signal pattern. As erratic as they might be (with slight nulls and peaks here and there), the patten from the CB antenna showed a GIANT lobe towards the rear of the car. It's not quite so pronounced now.

Need Packet Radio, APRS, Winlink and/or Emcomm Presentations at DCC (Digital Communications Conference)

As many of you know the ARRL / TAPR DCC (Digital Communications Conference) is returning to the Chicago area hear O'Hare airport
on September 25 - 27.

The DCC is the national premiere digital conference covering all digital modes including voice & data.

The DCC has 2 1/2 days of Technical forums on Friday & Saturday and on Sunday morning one or more deep dive sessions.

On Saturday there is a concurrent track of Introductory sessions.

While we have several great technical & introductory presentations already scheduled there are some topics we would like
covered with presentations:

1) Introduction to APRS

2) Introduction to Winlink

3) Introduction to Packet Radio.

4) Using Digital Modes for EmComm

While it is always better to present in person we recognize some of you may not be able to make it to Chicago, but would like to present.
This year we have the capability to support remote presentations using Skype for audio & Adobe ConnectNow for video.

If you are able to present on one of the topics above or perhaps another topic please let me know as soon as possible.

In the meantime, you can learn more about the DCC at: www.tapr.org/dcc

Look for an Alinco DR-135 and add a T2-135 TNC inside. Plug a serial
GPS into the front, or a Nuvi 350 into the back and you've got a nice
compact tracker. You might not have all of the flashy displays of the
D710 and you won't have the dual band, but you won't spend $600 either!

Lynn (D) - KJ4ERJ (-9 and -14 are as described above)

Hello, ARVN Customers!

First, the news:

We've just released a new 3-DVD set of videos from the Dayton Hamvention® 2009. Details - and some fun preview video - are on the ARVN web site (www.arvideonews.com), so I'll be brief here.

DVD-1 has our annual TOUR (well, I guess it's bi-annual, since I didn't get around to editing last year's TOUR. Jeff gives me grief for that, but the footage we shot then is included this year. Also on DVD-1 are the FCC Forums from 2008 (good-bye Riley) and 2009 (hello, Laura). And the ARRL Forum for 2009, with a good review of the newly UN-redacted FCC staff information on BPL interference.

DVD-2 has the TAPR and SDR (Software Defined Radio) Forums.

DVD-3 is all D-STAR, the Friday Forum and Friday Night Event.

That's all for the news. The rest is just me rambling... I won't be offended if you skip it...

And now, a request of ARVN customers: many of you have told me how much you like our videos, and that you hope we keep making more. Well, here's the deal with that. With four years experience in20making and marketing our DVDs, I can now tell you that it's just barely worth it, at least financially. The emotional payback is huge, but Burger King won't take that in payment for a double-Whopper.

In cash terms, the programs are mostly paying their expenses (travel, tape-stock, duplication), and they've paid off some of the equipment (camera, audio, editing system and software). But they haven't made a dent in my time. I've put in nearly eight weeks full-time editing the Dayton 3-DVD set. How much do you make in eight weeks? How much should I? (I'll give you some sales facts and figures below that you might find interesting.)

Enough whining. What can you do to help?

Get the word out!

Here's why: most hams have never heard of ARVN, aside from a few (very nice) reviews and New Product announcements in QST, CQ and a few other publications. We need to reach more hams. I've seen that a small, but significant enough number of hams become customers after they see what we've got. It's very satisfying to see that at a hamfest booth! But getting

hams to take a first or second look at ARVN videos is very difficult. We're all busy, and we've all got a lot built-in sales resistance. Most advertising is prohibitively expensive for this small operation.

Word of mouth (or word-of-keyboard) has been our most effective "advertising." It's your personal endorsement, and it's heard by people who know you. Now and then I'll see sales spike for one DVD or another a few weeks after the initial release and "rush." When that happens, a little investigation shows that someone placed a message on a mailing list somewhere, and BOOM, DVD sales take off again (relatively).

Here's how: Actually, I think you know it already. If you like ARVN videos and want to help us grow to sustainability (and make me rich... kidding), just use your "circle of influence" to tell people about us. Clubs, mailing lists, on-air discussion (OK as long as you don't work for me). Whatever.

Be gentle. Nobody likes a pushy salesman. You know the product. It doesn't take persuasion, just exposure. Point them to the demos on the web site, or show a DVD if it's convenient. You can make a "cold" announcement ("Hey, everybody - I've just seen this cool video I think you might like"). Or tie it in to a discussion that you come across ("I found this video that's great for introducing your club to D-STAR").

When I started ARVN, the chorus echoed the mantra: hams are cheap, you can't succeed. There's too much free video on the web. I didn't argue. I couldn't, because I more or less agreed. But I had to try. Now, I see the possibility of success. I see your notes of encouragement, and a certain level of actual sales (and repeat business) that tells me that it's worth trying a little longer and harder.

And... asking for help.

Some hard numbers for those interested:

My biggest seller is D igital Voice for Amateur Radio. No surprise there, it's an awesome program, if I do say so myself. I've sold 224 copies so far, grossing not quite $6000. Expenses ran around $3000 (travel to Dallas, Alabama, Chicago, St. Louis, 300 copies at about $2 each, 30 DVCam tapes at $12 each). Editing took 13 weeks full-time. Have you ever looked at the list of credits after a movie or TV show? I did this all by myself! Hmmm, no catering budget... No Best Boy, whatever they do.

Next on the hit parade are the TAPR 2008 DCC DVDs. That's sold 53 6-DVD sets, and 110 individual disks (428 total DVDs). Gross is $5900, also after about 12 weeks of editing. Travel expenses were lower, since it was a single trip to Chicago, but duplication and tape costs were higher.

The 2008 D-STAR meetings at Dayton: 102 copies. The Charlotte D-STAR seminar: 158 copies. The SWR seminar: 116 copies. The ARDF Fox Hunt documentary: 70 copies (hey, it deserves better than that!).

My conclusions: the "blockbuster" documentaries and "how-to" seminars are where most of the audience is, but not by so much that's it's a no-brainer to concentrate on them. And the "blockbusters" (I'll keep that in quotes - 224 copies doesn't make most blockbuster lists) are also the most expensive to produce.

Publicity is still the missing link. Maybe everyone who would want a D-STAR Forum DVD already has one - my access to that market is pretty good. And TAPR's 2008 DCC might be

tapped out, after=2 0sitting on their home page since February.

But you don't have to want to buy a digital radio to get something out of the "Digital Voice" DVD. I think every radio club in the country (in the world?) should play that DVD. That would be maybe 500 copies at least. It could get there, if they knew about it.

I'll stop now, as I'm reminding myself of Wayne Green! Bottom line - your help will be very much appreciated. Your reward will be having more ARVN videos... and if this is even reasonably successful, we'll get some competition with more professionally produced videos to enjoy and learn from. This is America!

Yes, if you plan to use a Nuvi with any of ArgentData's products.
The 350 is the only one currently of Garmin's Nuvi products with the
Fleet Management interface that handles waypoint updates properly.

From: w2edv
Topic: 6508 Message: 6508

Hi Everyone,

Along the lines of a recent Nuvi 350-centric thread, my understanding is that, the combination of the 350 with the Kenwood 710, connected via the Argent Data GTRANS cable, does not allow APRS messaging via the Nuvi touchscreen. Is this in fact correct?

I currently use a Garmin 276c in conjunction with my 710 and it works nicely, but it doesn't do tactical, and the 350 does show APRS station movement, which isn't tactical, but it is something.

The AVMap G5 is out of control, price-wise, although it looks to be a nice solution. One can purchase, say, a Garmin Nuvi 680 for $300 - $350. While the 680 isn't a new GPSr, it is similar to what one gets, APRS aside, from the G5. The newer auto GPSr units include voice prompting and other enhancements, but I see the G5 and the 680 as similar from a purely automobile navigation perspective (4.3" display compared with a 5" display). I guess I cannot reconcile the $600-$650 price tag.

Now, if the G5 contained an XM/Sirius radio/WX interface, as does my 276 (and, coincidentally, other AVMap products), that would be a slam dunk for me and I could justify the $600 price tag because I'd get a good quality car nav unit, a good-size display, the ability to select XM channels and view XM radar and textual/alert WX data AND the best APRS-related functionality.

what do you think?

thanks,

You are correct on that count. The Nuvi series only supports APRS messaging when connected to a Tracker2 or T2-135.

> I currently use a Garmin 276c in conjunction with my 710 and it works nicely, but it doesn't do tactical, and the 350 does show APRS station movement, which isn't tactical, but it is something.

There are many GPSs that will display waypoints when connected to many different APRS devices. The Nuvi series (except for the 350) have an issue whereby a moving station continually create new waypoints leaving a bread-crumb trail that slowly fills up your waypoint memory. The 350 correctly (for APRS purposes) MOVES an updated waypoint to the new coordinates.

Be aware that all Nuvis except the 350 display trailing breadcrumbs for moving waypoints. You will probably not be happy with any Nuvi except for the 350 for this reason.

For me personally the deal breaker with the AVMap was its inability to do any kind of topomaps for the US. I do a lot of offroad driving and need the ability to display topomaps and to display tracks and log tracks. I used the Garmin GPSmap 478 earlier (before it got stolen) with my D710. It's not a touch screen but it let me do almost everything I needed (apart from tactical). However considering the newer generation GPSs from Garmin are getting less and less APRS friendly, AVMap seems to have a unique positioning.

I finally decided to get a touchscreen UMPC - the Viliv X70. This is an Intel Atom based XP machine with a 7" touchscreen and an internal GPS. They start at $599 with a 16GB SSD. I got the one with a 32gb SSD and the built-in cellular 3G modem for $850. Till now I've been very happy with the device. I'm now exploring the right set of software (APRS + Navigation + offroad mapping/tracking). In addition it will serve as an in car media center. I think this will give me far more capability and flexibility than AVMap.

Cheers

Rohitash

You could use APRSPoint, a Windows-based app, that works in conjunction with MS MapPoint. You can buy APRSPoint stand-alone ($47, I think), or in a bundle with MapPoint ($77, I think).

APRSPoint exploits the MP functionality and can use as input internet supplied APRS packets (you mentioned 3G), as well as input from a TNC or a TNC-equipped radio such as a Kenwood 710.

Now, I bought APRSPoint (I already had MP) and though I DID have an issue with Vista Home Premium - APRSPoint would not work on my HP laptop with this OS and I updated to Vista Ultimate, APRSPoint is pretty cool. It can accept Peet Wx data (no Davis yet) as well as it's own NMEA GPS input. You could run this on a netbook, but you'll need a serial-to-USB cable THAT WORKS (many don't). I use a 2 headed serial DB9 to a single USB cable from CommFront.com.

You can follow a moving APRS station and can set filters to limit the packets you see. I would say that MP 2004 works much better than does 2009, because of the APRS icons. There is an APRSPoint Yahoo Group and you can get the s/w at aprspoint.com.

I have no affiliation with this product, other than having bought it and struggled with it for awhile. The main advantage here is the quality of the maps. UIView and other packages don't include their own maps, or, if they do, they aren't the same quality as MP.

Now, I am NOT certain if MP supports topo maps, or if any are available. I've thought about a netbook in my car - a hockey-puck GPS antenna/rx cabled to the netbook, along with the 710, or the GPS connected to the 710 itself, and a 3G WAN connection - that does sound sweet.

thanks/73

Yup, that is a correct statement, re breadcrumbs. I really wish Garmin would've picked up on this in a big way, but, if anything, they are moving AWAY from NMEA and therefore APRS. Too much attention there is being paid to hiking, biking and GPSrs made almost entirely of plastic. Just my 2 cents.

The marine GPSs are NMEA and will probably stay so until the maritime
navigation switch to another protocol. But that is not very likely.
I have been using a GPSMAP276C for boating, but I use it now as a car
navigator _and_ for APRS while driving (with a TM-D700).

The newer generation maritime/dual purpose GPS are moving away from serial out/NMEA it seems. The GPSmap 640 and 620 do not enable the serial port and NMEA in/out when in automotive mode. It works only in Marine mode where no routing is available. My GPSMap 478 had the NMEA output/input enabled in both modes. I exchanged some emails with the Garmin support person on this and he himself was surprised on why Garmin had removed that functionality - especially since the capability was obviously there in the device. So the 640/620, despite being a newer generation marine/auto GPS with touchscreen etc, essentially regressed in the APRS area.

Wow SECOND has 300 out of a max of 300 users and THIRD has 268 users out of a max of 300 users. Hopefully 32 clients won't connect and fill that one up too. With FIRST off line it looks like we're headed for a major meltdown.

Hi Stan,
You are so right maybe there needs to be more resources
added to help the situation.

With First down it looks like the kettle could boil over and run dry sooner
or later ..

At one point there used to be a FOURTH Tier One server. I still remember
the day that went away and everybody migrated to the three remaining
servers. System came crashing down for a few hours. If I recall
correctly that was on a Saturday too.

Hi Stan,
Yes with FOURTH gone its must have placed some more
loading on the 3 remaining ..

I wonder if the resources were updated to handle the extra load ?

Fingers crossed that not to many more Clients come online and fill up what
is left ..

Just got done chatting with Gerry, the sysop of first at TAMU.

He is heading to the datacenter to see what's up, as he can't remote into
the system right now.

I'm sure he'll post a sitrep when he gets things stabilized.

Just FYI.

> At one point there used to be a FOURTH Tier One server. I still

That was when I was running third and fourth out of two of my datacenters, but have since retired years back, as I sold off my service providing business to get back into full time broadcast engineering work.

I just don't think Gerry and Greg could find anyone else with a network admin willing to put up with the network load for a fourth server again.

Bandwidth isn't as much of an issue, it can run 3-4MB/sec 24 hours a day per core server (remember what you see on the status page for each server is payload data, not packet overhead data), but that's much in the grand scheme of things for most operations.

What is somewhat of a problem is the packet per second rating. I had to disable numerous intrusion detection rules to keep the traffic flowing from the swarms of <64 byte packets APRS-IS represents. On a Juniper M7 router, no small router, at my one site, turning off fourth dropped the CPU load on a router by almost 12%, to give you an example.

Add to that what ultimately is the knife are most folk's attempts to try this -- many commercial networks need to maintain SAS style security ratings from issues such as HIPPA and PCI compliancy. So opening up a bunch of non-standard ports on a non-vetted (by a security consulting firm) piece of software is just a non starter.

Gerry will have first back soon. I may not run a public server anymore, but I do still run a private one - and I still have my contacts :).

Kind regards,

Dave Anderson

I'm bringing up a new server soon and would consider offering it as a
core server, but I don't like the lack of transparency in the server
software. I'm sure Pete has his reasons for keeping it close to his
chest, but I'd rather not throw a lot of expensive resources at it
without a little more openness.

Never really noticed before but was surprised to find that the max
connects between all three is only 900. Load on core servers wouldn't be
so heavy if clients connected to Tier2 servers instead of Core servers.
You might be able to cut down the 300+ connections down 100 or so for
each server.

Hi Stan,
wasn't this the very reason the T2 servers were set up to
minimize the load on the CORE ..

Do we need to educate some ..

I have posted a request here in NZ that Igates connect to the T2 servers
explaining the problems within the core at the moment

Hi Stan,
Ummmm doh !!!! Yes a great question

As I understand it and I have only been involved for a 1 year or so with T2
operation

T2 was set up to help limit the client connections to the CORE

But as time has slipped by the CORE have reconsidered their place and appear
to
allow these client connections..

Yea if all the clients where on the T2 network there would be about 190
free spots ...

OH well at least Gerry got first up and running a job well done ..

I use a 10k thermister as R1 and a fixed 10k resistor as R2 in a voltage divider connected to 5 volts from the TNC. The resulting curve is a cubic, but it can be within a degree over quite a temperature range. I get the thermisters from DIGI-KEY, but dont have any refference here at home...

6533. Re: [APRS] GPS Units

Yahoo group: APRS (2007 — 2010)
Date: 2009-08-23 21:35:54 UTC
From: CaptALord@aol.com
Topic: 6488 Message: 6533

It sounds like what you are asking for is a dash-top GPS display unit with true NMEA serial output. A NUVI is just not going to do that, so you can safely discard these from the selection options. There are a few "navigator" style units left out there with serial (not USB) outputs, but the best of these for APRS is clearly the AVMAP GPS V, the only one really designed for APRS operation. Based on your statement that you will be running a PC, you could easily just go with a serial Hockeypuck? (Byonics or Argent Data , etc.) and save a lot of money.

> before I take the $200.00 or so plunge...

You don't mention what sort of APRS devices you wish to connect it

to. If you have or are considering getting a Tracker2 or a T2-135

(that last fits inside an Alinco 2-meter mobile), then hurry up and

buy one of the Nuvi 350's while there are still a few available.

You might already be too late.

Radio Shack has refurbished units for $110 or so, web-purchase only,

delivered for free to a RS near you.

The 350 is the only one of the Nuvi's that when presented with

another waypoint the same as one it already has, moves it. All

others that I know of end up plotting both, so mobile APRS is a mess

with them.

Any NUVI with Fleet Management Interface can also do 2-way APRS messaging through a Tracker2 or T2-135 also. See the Argentdata.com side for details on which Nuvi provides which features when connected with a Tracker2.

Of course just checking the site I'm not getting in right now...

The 350 is the one you want though if you can get it. Others are less capable. The 350 is evidently out of production. If only Garmin would make some small software tweaks in their current models...

There is a special going on till the end of the month on these
refurbished Garmin Nuvi 350 Navigation units at Radio Shack:

http://www.radioshack.com/product/index.jsp?productId=3480192

These are the infamous units that can properly display APRS icons,
comments, and messages on it's LCD display when interfaced with an
Tracker2 TNC device from Argent Data Systems.
http://www.argentdata.com/support/tracker2.html

More info on the interface & functionalities can be found here:
http://wiki.argentdata.com/index.php?title=Garmin_FMI

This is a pretty good deal, I ordered one for myself this weekend.

Will let you know how it goes.

With my GTRANS cable, the nuvi 350 works nicely for APRS. You don't get the messaging features you would on the Tracker2, but it makes a much cheaper alternative to the AVMAP units.

Lee,

Check out http://www.aprs-is.net/APRSServers.aspx for the list of the Tier 1 servers (there are three of them). These are the servers that bridge together all of the various feeds to APRS-IS.

Two other organizations have stepped up with Tier 2 networks of APRS-IS servers for the masses. The larges it the APRS Tier 2 Network at http://www.aprs2.net/ and the other is the iGATE-APRS Team at http://www.iaprs.net/. This second group appears to be 50% offline, so I'm not really sure of their status.

However, the final word, in my opinion, for a consumer's use of APRS-IS are the regional rotating DNS names put together by the Tier 2 network as seen on the map at http://www.aprs2.net/#regional. If you use the appropriate rotate address, there's an almost certainty that you'll get a connection to something. For instance, noam.aprs2.net current translates to 17 different IP addresses, all of which offer APRS-IS users the same collection of ports, particularly ensuring 14580 filtered port access.

Your mileage may vary, but if I was just running an APRS-IS client application at home, I'd use the tier2 DNS names and port 14580.

Yup. The sale has been on and off for some time. I ordered four last month and they were delivered for free to my house and quickly. The only gotcha was I had to pay sales tax for WA. I was not being greedy; I was ordering for a special event which included ordering tracker2s and cables from Argent Data.

Early bird gets worm.
You snooze, you loose.

Sorry. Too much coffee while working on documents.

When RS put them on sale in both May and July, they seemed to be selling out every two or three days. Then the 'Out of Stock' notice would change to 'In Stock' again.

Be patient as there are obviously more since Garmin still has them on their factory outlet page as refurbished at $166.99 and free shipping.

From: Scott Miller
Topic: 6508 Message: 6541

There's presently no messaging on the D710's GPS port, so no way to do messaging through the GTRANS. If I could convince Kenwood to add message input and output on the GPS port, it'd be pretty simple to add support, though.

Kenwood TM-D700A with Delou mouse style GPS. Includes printed manuals, Mic, Bracket for the face plate, Aftermarket Separation Kit (original cable went bad and has been discarded), PC Programing cable, and power cord.
I'll also include a CD with manuals (in .pdf format), programming software and other software for APRS. This rig is fully functional and is in 8 out of 10 condition. It has been mobile. Serial Number: 11100077

$400 shipped. No trades this time guys, I need cash.

Call Steve @ 309-371-0540
kc0rey@...

See this station working right now @ http://www.findu.com/cgi-bin/find.cgi?kc0rey-1

Thanks Scott,

Re the 350, maybe I'm being greedy, but it seems to me that this would be much more useful in a car if the display was larger. It is one thing to follow a moving map on a GPS this size, as the map is zoomed-in and there is just the icon for your car. But, when viewing APRS stations, the 2.1" x 2.8" (or whatever it is exactly) is too small.

My Garmin 276 has a much larger display and even there it can be difficult to discern one station from another in my car. Granted, the 276 uses a gray square as the default icon, so all icons look the same, but, depending on your location, you might not see any very-near APRS stations until you zoom out to a larger area map. And, when you do that, the icons are smaller.

it's too bad that the functionality provided by the 350 in concert with the GTRANS can't be replicated in the larger-display Garmin units, like the 680 and other larger-display models.

Take it up with Garmin. They're the ones that have different FMI and waypoint behavior in the 350 vs any of their other GPSes. Also, the GTRANS doesn't currently do messaging. I'd really love to have a larger display GPS, but the Nuvi 350 paired with a Tracker2 (or T2-135 in my case) makes a "good enough" APRS station at the right price for my budget.

Lynn (D) - KJ4ERJ (-9 and -14 are Nuvi 350s with T2-135 and Alinco DR-135s)

The moment Garmin adds waypoint support to the newer, larger units, I'll
be building new GTRANS cables for those.

Date: 2009-09-02 02:49:42 UTC
From: kc0rey
Topic: 6548 Message: 6548

I've been looking at the Opentracker+ and I was wondering if anybody uses this with a 5W HT. I downloaded the manual for it and glanced through it. How difficult would this be to set up? My APRS experiance is with a Kenwood TM-D700a and UI-View. Both do everything for you so I guess I am kinda dumb when it comes to the other options.

I used the OT+ with an old Kenwood HT, a 5/8 wave antenna and a hockey-puck GPS for about a year before I upgraded to a TM-D710. It worked great and with the help of a couple of local digi□s and I-gates, I was tracked turn-for-turn all around the county.

Programming and installation is a snap and the price is sure great.

I just sold mine 2 days ago for almost what I had invested in it. I hated to let it go, but with 2 TM-D710□s I just didn□t have a need for it and I hate to let stuff sit around unused.

FWIW, when I put it up for sale on my club□s Yahoo group, I had 6 people wanting to buy it. I think that speaks a lot for its quality and utility.

Subject: [APRS] A question about Opentracker+

I've been looking at the Opentracker+ and I was wondering if anybody uses this with a 5W HT. I downloaded the manual for it and glanced through it. How difficult would this be to set up? My APRS experiance is with a Kenwood TM-D700a and UI-View. Both do everything for you so I guess I am kinda dumb when it comes to the other options.

6554. accessing APRSIS with D710?

Yahoo group: APRS (2007 — 2010)
Date: 2009-09-02 12:49:20 UTC
From: svkaereste
Topic: 6554 Message: 6554

Does anyone know, while using the D710 (or any of the other Kenwoods for that matter), when beaconing, do messages get automatically sent to (and received from) APRSIS or do I need to add this to my path?

I guess I'm not totally clear on how I can text message through the APRS internet system. Direct vehicle->vehicle or vehicle->digi
->vehicle doesn't seem to be a problem.

Also, do the messages sit and wait until the addressee connects or is there a decay time? Is there a way to set the decay time to "never decay" if needed?

Perhaps the trouble is that not all digis connect to APRSIS or WINlink.

Just need a bit of clarity here.

Tnx, 73

john
K2QY

6555. Re: [APRS] accessing APRSIS with D710?

Yahoo group: APRS (2007 — 2010)

From: Lynn W. Deffenbaugh (Mr)
Topic: 6554 Message: 6555

John (brace yourself for a long answer to a short question),

Provided that there are IGates within RF earshot (direct or via Digis), any and all packets you transmit will be gated onto the APRS-IS and will be transported around the world. There are numerous APRS-IS monitoring/viewing sites, but my personal favorite happens to be http://aprs.fi.

The APRS-IS proper is simply a real-time distribution pipe. There is nothing inherent in the -IS that buffers, stores, nor even interprets APRS packets (much). The web sites that you might encounter to view APRS data are each listening to the APRS-IS in realtime and are doing their own collecting, filtering, interpreting, and storing of that data.

So, what about messaging? Here's the fun part. Every APRS-IS IGate maintains a list of "locally" heard stations. This may be only directly heard stations over the RF or is typically configurable to include stations up to N (digi) hops away. This list is also timed so it can be thought of as a list of "recently" heard "local" stations. At the same time, the IGate is monitoring the APRS-IS stream for APRS message packets. When it encounters one, it checks the destination of that message against the list of recently heard local stations. If there's a hit, the APRS message packet is wrapped in a third-party packet and gated to RF.

However, this ONLY works if the IGate operator has configured his/her IGate to gate messages from -IS to RF and s/he has transmitting capability at the IGate and there's an RF path from the IGate back to the destination station. That's a lot of variables that have to align to work. And, unfortunately (IMHO), there's way too many receive-only IGates in the world (at least, in the US). I'm guilty of having run my IGate as receive-only until I realized what confusion I was adding to the local network. Packets would show up in -IS from -RF, but yet messaging back out to those stations would not work. As soon as I learned that, my IGate became bi-directional.

So, when using ANY APRS station on RF, if you are within range of an IGate, the whole world can see your packets. You can send messages to any of the APRS-IS-resident services (like CQSRVR (http://www.aprs.org/cqsrvr.html) and WHO-IS (http://www.aprs-is.net/WhoIs.aspx)) or any other APRS (-IS or RF) user world-wide.

And, if you're in range of a bi-directional IGate, anyone around the world can send messages to you knowing only your call-sign.

As for buffering and retrying and stuff like that, the short answer is no. On the RF side, APRS clients are supposed to implement a re-transmission decaying algorithm until and ACK is received (which won't happen without the appropriate IGates), but many of them don't, however I believe the Kenwoods do. But if the destination station is not on-line or in range to receive your message when you transmit it, there is no buffered delivery at a later time (at least, not yet, I'm working on some ideas).

That said, there is also an EMAIL-2 server (http://www.aprs-is.net/Email.aspx) which will gate APRS messages to an e-mail address, but e-mailing back to an APRS client is problematic. There's supposedly some servers that do something in that line, but I'm not personally familiar with them.

Anyway, I hope this answers your question (and then some). Others will also hopefully benefit from this diatribe and will give their APRS messaging a try!

I have an APRS-IS client on-line nearly all the time. You can send a message to KJ4ERJ-12 and should at least get an ack and possibly a response from me if I'm anywhere near my cellphone at the time!

Dear Lynn,

That is a very well done in depth answer to my questions. Obviously, since I am trying your APRSISCE on my phone too, I have been trying to see what works and what doesn't here in the Albany NY area. One reason for this is that I will be putting on an APRS progam soon for a few local clubs and perhaps local officals too. That said, I am trying to learn as much as much as I can, beyond just beaconing. I believe the better I understand it, the better I can teach it ;-)

Thanks and 73

6558. Getting GPS signal to the TM-D710 from my laptop

Yahoo group: APRS (2007 — 2010)
Date: 2009-09-03 18:35:34 UTC
From: Rohitash Singh
Topic: 6558 Message: 6558

Hi,

I have the Viliv X70 with a built in GPS running XP. I have APRSPoint running on this and it successfully connects to the D710 for receiving APRS packets as well as transmitting position info. I use a two port USB to serial cable (from Cables Unlimited) with one of the ports connected to the PG-5G cable. The built in GPS on the X70 is available on COM2 and I use xport to split it to COM3, 4 and 5. APRS point receives the GPS feed on COM5 and it works well. I've also used MapPoint 2009 independently getting the GPS signal on COM3 and that works fine too.

Now is there a way to get the GPS signal to the D710 directly? The reason I want to do this is so I can use the D710s APRs features to transmit my position. I used to have a GPSMap 478 connected to the D710 earlier and was very happy with the way the D710 handled position updates. Being brand new to APRSPoint, I've not been very successful in having it automatically keep my positions updated. If I could get the GPS signal to the radio then I'd have both options available.

What I'm thinking is some software that could 'redirect' the GPS signal from one of the com ports to another com port. That way maybe I could use the second port of the USB-Serial cable and wire it into a home made cable to the GPS port on the D710.

Feasible? Suggestions?

I'm cross posting this to multiple forums so apologize if some of you get duplicates.

The GPS is built-in to my computer. Its NMEA data stream is available on COM2 which is an internal port - ie is not available physically on the computer as an external port. I have got a dual port USB to Serial cable and I'm using one of those ports (available as COM 5 in my computer) to connect to the TNC on the D710. I'm trying to figure out if there is a way to redirect the NMEA signal on COM2 to the second port of my USB to Serial cable (COM6 on my computer). Then I could build a home made cable to connect between the DB2 plug on the USB-Serial cable and the GPS port on the Radio.

I'm trying to avoid buying a second GPS device just to connect to the radio.

Cheers

Rohitash

Den Connors, KD2S (SK) (Sep 3, 2009) -- The first president of Tucson Amateur Packet Radio (TAPR) Den Connors, KD2S, of Pepperell, Massachusetts, passed away September 3 from lymphoma. He was 58. Connors, an ARRL Life Member, conducted the first amateur packet radio contact with all-American hardware and software, using the Tucson Amateur Packet Radio Terminal Node Controller (TNC) with Lyle Johnson, WA7GXD (now KK7P), at 9:12 PM (PST) on June 25, 1982. The tests were conducted at 146.55MHz, with both stations sending plain-text ASCII messages. "Den was instrumental in the early PACSAT work, and as TAPR's first president, led that organization from a local club he co-founded into an international organization," Johnson said in an e-mail. "His was a very cheerful, positive, can-do influence."

The Tracker2 or the T2-135 will both do it. The T2-135 fits inside
the Alinco DR-135T radio (don't buy the Alinco TNC board). There's
also the T2-301.

I don't know of others that can use the Garmin Fleet Interface Mode.

You'll need to build or buy a cable that puts the GPS into the fleet
interface mode. Recent discussions on APRSSIG or maybe the Tracker2
list detailed which cables you need for what.

> Do I gather correctly that one uses the Linux/BSD-based OpenTracker software
> or will most any APRS app interface with it? (I only use Linux.)

You might need an APRS app that talks KISS mode to be able to run
APRS software on a laptop talking to a T2. In KISS mode you lose
the ability to get the GPS data from the TNC. Another possibility
is to use the non-KISS mode and see if the TNC supports the
Control-E method to get the GPS data, also known as PicoPacket mode
'cuz that's the first TNC or perhaps the most well-known TNC at the
time that implemented it. I know I mentioned Control-E mode to
Scott before but I don't recall now whether he implemented that.

For flashing new firmware into the TNC you can use Windows under
WINE to do it (I've done this 3 times so far successfully, using a
laptop with a real serial port). You can also send the flash image
using a comm program, the procedure was documented on the Tracker2
mailing list.

For configuring it: Similar options as above plus you can configure
it remotely once you set up the remote ID to use.

I have some Tracker2's, all early models, but haven't tried all the
possible ways to configure them yet.

> Will this also interface with the traditional 2m Packet system or would I
> need a TNC or sound card interface for that?

The T2's are purpose-built TNC's for APRS. Back-to-back packets
and/or large packets may not work. Stick to small packets that are
received one at a time and it will probably work for you. Of course
you can't control what the remote station might try to send you.

For a general setup that can be used with nearly any APRS or TCP/IP
or AX.25 software, check out the Kantronics KPC-3+, but it's quite a
bit more expensive. No fleet management mode but it will do
Control-E, KISS, and both large and back-to-back packets.

6568. ARRL/TAPR DCC (Digital Communications Conference) Forum Schedule Announced

Yahoo group: APRS (2007 — 2010)
Date: 2009-09-10 02:15:08 UTC
From: Mark Thompson
Topic: 6568 Message: 6568

ARRL/TAPR DCC (Digital Communications Conference) Forum Schedule Announced

TAPR is the premiere national digital organization covering all digital voice & data technologies and digital techniques such as SDR. More information about TAPR can be found at: www.tapr.org

TAPR is active throughout the year. At the Dayton Hamvention TAPR sponsors a digital forum and a joint banquet with AMSAT. TAPR publishes a quarterly journal, the PSR and develops digital techniques such as SDR. TAPR holds in conjuntion with the ARRL an annual national Digital Communication Conference. You can follow TAPR's activities, events & updates regularly
on Twitter at: www.twitter.org/taprdigital

The ARRL/TAPR DCC (Digital Communications Conference) will be held on September 25 - 27, 2009 again in the northwest suburbs of Chicago at the Elk Grove Village Holiday Inn near O'Hare airport with a free hotel shuttle bus.

The DCC has something for everyone from those new to digital modes to those experienced with digital communications.
The DCC has 2 full days of Technical forums on Friday & Saturday. On Saturday there is an additional
concurrent track of Introductory forums. On Sunday morning there is a 1/2 day technical session which is a deep dive into
one or more digital topics, such as SDR.

The DCC is well known for introducing new technologies & concepts. This
year presentations include:

* Two Ham DTV, Digital Television presentations by Art, WA8RMC & Ken, W6HHC.
* "Use of Digital Communications at the Marine Corps Marathon in Washington D.C." by Tom, N4ZPT.
* "Universal Ham Radio Text Messaging" by Bob Bruninga, WB4APR, creator of APRS.

After the Friday night social we plan to have another D-STAR get together.

The Saturday night banquet speaker will be Bill Brown, WB8ELK. Bill is a pioneer in flying BalloonSats,
balloons with payloads including amateur radio digital communication technologies.

You can learn more about the DCC & register on-line at: www.tapr.org/dcc
Registration is preferred prior to September 17th for planning purposes, but walk-in registrations will be accepted.

If you can't attend the DCC the Proceedings can be purchased at the TAPR web site at: www.tapr.org/pub_dcc.html

Starting last year, 2008 and continuing this year DCC presentations are being recorded by Amateur Radio Video News. DVDs of the prresentations are available at:
http://www.arvideonews.com

If you have any questions you can reach the TAPR Office at: taproffice@...

Look foward to seeing many of you at the DCC.

73, Mark, WB9QZB
DCC Local Co-Host
Chicago, IL

The 2009 DCC forum & speaker schedule is attached & is available online at the TAPR web site at:
http://www.tapr.org/pdf/DCC_2009_Schedule_Preliminary2009-09-08.pdf

Unfortunately, there are not many Garmin GPS units that put out NMEA which is what the TT4 needs. Most of the Garmin's have a proprietary binary output, a.k.a Fleet Management Interface (FMI). To my knowledge, only ArgentData's OpenTracker2 will work with the Garmin FMI. To that extent only the Garmin Nuvi 350 will plot the correct position. The rest of the Garmin units capable of the FMI protocol leave breadcrumbs as the target moves.

The TinyTracker series was meant to be used with a GPS puck.

Correct. The Nuvi 350 is out of production as well, but refurbished
units can be had for around $109 (from RS for one).

ArgentData also has a stripped-down Tracker2 in a cable that can be
used to connect a Nuvi to a Kenwood radio. The smart cable
generates NMEA serial from the Garmin interface, so that gives you
yet another method to connect up a Nuvi. I believe there's a
version that has a DE-9 connector so that would work with a TT.
Last I heard he was waiting on something to get the next batch of
them made, so check with ArgentData on availability of those cables.

Yeah, still short on some parts but I'm expecting a batch in tomorrow.
I'm not certain it's going to be enough to cover the existing orders for
the Kenwood style, but there should be plenty of the d-sub version.

Assuming I get my test system back up and running... it crashed today
and I've got to try to get XP reloaded on it.

Hi Steve

I've been very happy with APRSPoint and would recomend it so long as you can live with its current limitations. In my case that's the lack of IGate functionality and the inability to connect to it via TCP/IP. I would also highly recomend UI-View. It's a very powerful program and is nowhere near the end of its life. All of the add-ons make it very powerful. (I'm not making your decisioin any easier, am I?) In short, I've been using UI-View since not long after it came out. I've also been using APRSPoint on and off for a couple of years and I can't make up my mind either. In fact, I run both at the same time on our balloon chases.

Topic: 6569 Message: 6576

Hi,

Originally I used an old Garmin GPS III+, then moved to a 60Csx and finally onto what I use now, the GPSMap 276c.

with the 276, as with the other aforementioned units, I get NMEA in/out as well as the ability to tune XM Radio and XM Weather (from WxWorx) via the external GXM-30 antenna.

The cost of the 276 was not inexpensive, but it does ALMOST everything I want. I wish it would represent APRS stations with the correct icons on the map. It would be nice to have tactical mode, but for me it isn't a necessity. The AvMap G5 does these last two, but it is $600. That is the same price as I paid for my 276, but the ability to do away with another unit in my car (the XM radio) was a big plus.

I don't think the 276 is made any more, but you can still find them and it came with the GXM-30.

One other thing I forgot to mention.... the Nuvi 350 is the only Garmin with the Fleet interface that can show an APRS station's progress across the map. It does require a special cable, one made by Argent. Here is the link:

https://www.argentdata.com/catalog/product_info.php?cPath=28&products_id=114

I think the 350's screen is quite small though. Also, you can't do APRS messaging through when connecting to the Kenwood TND-710A via the Argent cable. When using the Nuvi, the Nuvi 350 with a Tiny Tracker, the messaging is available via a soft keyboard on the 350 screen. This is dues to the fact that the Kenwood 710 can't accept mesaging data except through its own control head.

Almost. The FMI isn't supported by TinyTracks (that I know of), but by
Open Trackers (OT2m and/or T2-135).

Lynn (D) - KJ4ERJ - TinyTrak4 IGate/Digi as -2/-7 - T2-135 w/Nuvi350
mobile as -9

I have a 276C (previously used in our boat, now in the car). It's
still on Garmin's web pages.

In the boat, I use a GPSMAP 525s, connected to both the maritime VHF
and to my TH-D7 for APRS.

6584. Which Software Program w/Vista OS

Yahoo group: APRS (2007 — 2010)
Date: 2009-09-12 17:41:13 UTC
From: transphos585
Topic: 6584 Message: 6584

New to APRS, have D710 which I plan to use as a base for the moment. Would like input on software; appears UI View or AW Tracker are the top choices, then again I could wrong in that assumption.

If UI View, which version 16 or 32 bit

TU for your input, if I need to supply more info let me know

Doug AG5I

6585. Which UIView program w/Vista

Hi Doug,
You need to install the 32 bit program.
Then go to here www.apritch.myby.co.uk/uiv32.htm to register it.
Robin. ZL3REW.

From: svkaereste
Topic: 6588 Message: 6588

Dear Group,

I just up loaded my power point presentation to the files section. Anyone can use it or modify it as they choose. Let me know your comments and if you see any errors.

Thanks especially to Bob and Lynn for the screen shots and info I stole.

I am planning a bit of commentary to go alone with it, but have not put that all together.

6589. Opentracker+ questions

Yahoo group: APRS (2007 — 2010)
Date: 2009-09-14 03:46:12 UTC
From: Bob Bruninga
Topic: 6569 Message: 6589

Scott,

I just read the operntracker+ manual cover to cover and I think I missed two things I was looking for:

1) I cant find any mention of what TX format is used. Is it Mic-E or is it standard APRS? There is a switch for "compressed" but no mention of what it is otherwise. I hope it is not raw NMEA...

2) the spec says it can receive packets but then I can't find any further mentinon about receiving packets. There is a button for setting waypoint output, but is that the only receive format?

Can the Opentracker+ be connected like any other TNC and used to monitor packets?

For the next revision of the manual, it would be nice if these topics were explicitly addressed.

thanks

Looks like a great product, I wish I had mroe time to play!

Bob, Wb4APR

Standard APRS format (with optional !DAO!) or Base91 if you've got the
'compressed' option enabled.

> 2) the spec says it can receive packets but then I can't find any
> further mentinon about receiving packets. There is a button for setting
> waypoint output, but is that the only receive format?

Unless you load the KISS firmware, yes. I've got a version that puts
out packets in TNC-2 format, but I haven't finished the input side yet.
The idea was to make it work with non-KISS software.

> Can the Opentracker+ be connected like any other TNC and used to monitor
> packets?

With the KISS firmware loaded.

> For the next revision of the manual, it would be nice if these topics
> were explicitly addressed.

Yes, it needs a lot of updates. The wiki is more active right now, and
at some point I'll clean it up and fold a lot of that back into the manual.

I'll comment on this part. The REALLY cool thing about the $32 OpenTracker 1+ is it's capability to decode packets without any additional hardware. When in normal tracker mode, the OT1+ can output $GPWPL waypoint strings with truncated names up to 9 chars long, enough for a 2x3 call with two digit SSID.

Another great option is re-flashing the OT1+ with the KISS firmware and turn it into a general purpose KISS TNC for full TX and RX. The new HamHUD II+ has a built-in "modem" that is based on the OT1+ flashed with the KISS firmware. The decode capability is so good, I felt it was adequate for the internal TNC option.

From: Robert Bruninga
Topic: 6569 Message: 6592

>>> The FMI isn't supported by TinyTracks
>>> (that I know of), but by Open Trackers
>>> (OT2m and/or T2-135).
>>
>> Just Tracker2 variants - OT2m, T2-135, T2-301
>> - not the OpenTracker 1 or OpenTracker+.

What I'd really love to see is a common way of indicating APRS functionality in all APRS devices.. Curt maintains an excellent spread sheet of client capabilities:
http://www.eskimo.com/~archer/aprs_capabilities.html

but we need one for devices too, I think. These are the salient features I am interested in seeing for all devices:

POS FORMAT (APRS, Mic-E, compressed, NMEA, grid)
Message bits (switch seslectable)
Multi-position comments?
Separate Status Texts
Beacon texts
Telemetry (5 channel standard, other)
CW Beacon
CW Text
Serial-to-packet TX
RX-to-serial packet
KISS

I believe there's a list somewhere on the ArgentData or
info.aprs.net sites that tell you. The Nuvi 350 is the best one,
all others suffer from the multiple waypoint problem.

Got the link you sent in the other message, thanks.

I don't use the waypoint upload feature on my D700 so it doesn't really matter that it has a problem with multiple waypoints. I just wanted to be sure I could find a unit that would provide a data output so that I could use a GTRANS cable with the Kenwood and use only one GPS for both navigation and a data feed to the radio.

6600. WB4APR Presenting APRS at Digital Communications Conference, September 26th

Yahoo group: APRS (2007 — 2010)
Date: 2009-09-15 19:08:32 UTC
From: Mark Thompson
Topic: 6600 Message: 6600

The ARRL/TAPR DCC (Digital Communications Conference) in Chicago on September 25 - 27 has some very interesting forums & presentations this year including:

- Bob Bruninga, WB4APR presenting "Universal Ham Radio Text Messaging"

WB4APR's presentation is scheduled for Saturday afternoon, September 26th.

More details about the DCC & the forum schedule are below.

ARRL/TAPR DCC (Digital Communications Conference) Forum Schedule Announced

TAPR is the premiere national digital organization covering all digital voice & data technologies and digital techniques such as SDR. More information about TAPR can be found at: www.tapr.org

TAPR is active throughout the year. At the Dayton Hamvention TAPR sponsors a digital forum and a joint banquet with AMSAT. TAPR publishes a quarterly journal, the PSR and develops digital techniques such as SDR. TAPR holds in conjuntion with the ARRL an annual national Digital Communication Conference. You can follow TAPR's activities, events & updates regularly
on Twitter at: www.twitter.org/taprdigital

The ARRL/TAPR DCC (Digital Communications Conference) will be held on September 25 - 27, 2009 again in the northwest suburbs of Chicago at the Elk Grove Village Holiday Inn near O'Hare airport with a free hotel shuttle bus.

The DCC has something for everyone from those new to digital modes to those experienced with digital communications.
The DCC has 2 full days of Technical forums on Friday & Saturday. On Saturday there is an additional
concurrent track of Introductory forums. On Sunday morning there is a 1/2 day technical session which is a deep dive into
one or more digital topics, such as SDR.

The DCC is well known for introducing new technologies & concepts. This
year presentations include:

* Two Ham DTV, Digital Television presentations by Art, WA8RMC & Ken, W6HHC.
* "Use of Digital Communications at the Marine Corps Marathon in Washington D.C." by Tom, N4ZPT.
* "Universal Ham Radio Text Messaging" by Bob Bruninga, WB4APR, creator of APRS.

After the Friday night social we plan to have another D-STAR get together.

The Saturday night banquet speaker will be Bill Brown, WB8ELK. Bill is a pioneer in flying BalloonSats,

balloons with payloads including amateur radio digital communication technologies. Bill is also the publisher &
editor Amateur Television Quarterly Magazine.

You can learn more about the DCC & register on-line at: www.tapr.org/dcc
Registration is preferred prior to September 17th for planning purposes, but walk-in registrations will be accepted.

If you can't attend the DCC the Proceedings can be purchased at the TAPR web site at: www.tapr.org/pub_dcc.html

Starting last year, 2008 and continuing this year DCC presentations are being recorded by Amateur Radio Video News. DVDs of the prresentations are available at:
http://www.arvideonews.com

If you have any questions you can reach the TAPR Office at: taproffice@tapr..org

Look foward to seeing many of you at the DCC.

73, Mark, WB9QZB
DCC Local Co-Host
Chicago, IL

The 2009 DCC forum & speaker schedule is attached & is available online at the TAPR web site at:
http://www.tapr.org/pdf/DCC_2009_Schedule_Preliminary2009-09-08.pdf

6605. Looking for an APRS expert . . .

Yahoo group: APRS (2007 — 2010)
Date: 2009-09-15 17:50:21 UTC
From: Jerry Dwyer
Topic: 6605 Message: 6605

I joined this group to be able to send a request to the appropriate people. I run a "Technology Net" on our club repeater. Every Friday evening we have a guest speaker do a presentation on a technical subject. Not only do we have listeners directly on the repeater (Kansas City area), but we connect up to Echolink and IRLP to make the presentation available anyway in the Internet world. We have had some crowds as big as over 100 connections, depending on the subject.

To get an idea of the kind of things we cover, please go to this URL and take a look at the webpage that has all the presentations listed. If you click on a subject, you will go to a webpage that shows an outline of the presentation. If you click on one of the top three listings you will then be able to click on an embedded player and here an audio recording of the presentation and along with that is a video shortcut that starts the video slides to go along with the audio.

http://k0gq.com/technet.htm

We have had many requests to get a speaker to do a presentation on APRS. I find quite allot of interest and many Hams seem to know little about it. From the basics to today's APRS repeaters and how you would use it for yourself and what you would need to purchase to get started. The presentation could be done from anywhere using Echolink to communicate. We have done it from all over the U.S. with perfect results. Normally a presentation goes from 30 to 60 minutes with a question and answer period at the end. I would be creating an outline of the presentation on our website, but a .pdf slide show to go along with it makes the presentation come alive. So, how can I find that expert to help us out, please let me know and thanks.

Jerry - NF9L

Call me crazy (and some have) but that looks like a re-designed TinyTrak II on a single sided PCB. The four LEDs kind of gave me that impression. For kicks, go download the TinyTrak II config software and try to read it.

Depending on how they configured the serial port on the tracker, you may or may not have to use a null modem adapter to talk to it.

Hi Duncan

Unfortunately that's exactly what it is. He has been selling these on eBay
and distributing a hacked version of my DOS configuration program for years.
I reported it to eBay several times to no avail.

My advice: Please support Byon, the one who designed the TinyTrak devices
in the first place.

Call me crazy (and some have) but that looks like a re-designed TinyTrak II
on a single sided PCB. The four LEDs kind of gave me that impression. For
kicks, go download the TinyTrak II config software and try to read it.

Depending on how they configured the serial port on the tracker, you may or
may not have to use a null modem adapter to talk to it.

Hi all,

I have had a board for about 12 months now but have never got it
operational. I have now misplaced the CD-ROM with the Instruction Manual and
Setup Software on it.

Anyone able to help out with this one??

If anyone is using one of these also I would love to hear from you!

From: rrath@charter.net
Topic: 6610 Message: 6610

I am on vacation and left my cheat sheat at home. I run WAPRS now that I got a laptop that can handle everything. The problem is I do not remember how to set (what to type in) the different boxes that need to be filled in. I run the free progam; atleast until I get home to buy the registry code; so I do not have to keep typing everything in. Can some one tell me what I need to type in the boxes and what boxes to check to set up everything. Thank you. I will try and check my email later tonight. Rod kc7vqr

6611. APRS tracking etiquette question

Yahoo group: APRS (2007 — 2010)

From: k7rbw
Topic: 6611 Message: 6611

I was wondering if I wanted to track something more frequently than once every minute or two, would be OK to have the tracker operate on some unused freq that's not 144.390? I plan to also use my own receiver and iGate to put the resulting packets on the APRS-IS server.

I'd like to get higher precision tracking but still use the APRS web-based tools for mapping, logging, etc.I also want to be a good citizen and not tie up a shared frequency.

I just wanted to know (before hand) if this type of operation would have other, undesirable side-effects.

Thanks!

Bob,

javAPRSsrvr has a duplicate detector that defaults, I believe, to 30 seconds. If you try to send in updates faster than that, and the packets look the same (ie no movement and no second-resolution timestamp), it will silently suppress them. So, if you're beaconing faster than 30 seconds, don't be alarmed to see "dropped" packets when viewing the APRS-IS.

Of course, this duplicate suppressor shouldn't be an issue if you're actually moving!

Duncan,

It took a little work, but I found the pdf manual for the unit online. It says that the unit sends NMEA data out the serial port continuously during operation, so it should work fine. The Uniden is an interesting device. It looks like it was designed to circumvent problems in areas where Radar detectors are illegal. Very cool.

Topic: 6616 Message: 6616

Tomorrow (Friday 9-18-2009) we will be making another trip from NJ to GA, then GA to NJ a week later.
Just reinstalled the old dog tracker (TT2) into the new ride.
The suitcase tracker has been tossed around many cars and trucks, left in garages when dormant and like a Timex watch it keeps on ticking.
The display on the ETrex is almost dead, the entire setup has been subjected to +200F to -10F and is still doing the job.

The last time i updated the web page was back in 07, APRSWorld was almost worth something back then, but as i see on findu and on my page it is not up and working at all.
Ironically i input the SSID of kb7tbt-9 on APRSWorld and it has data from 07 when i went through NM.
Whatever i guess. Never was impressed by them at all.
I dont have time to mess with the webpage so it is what it is.

The URL to my webpage is http://kb7tbt.com/aprs/kb7tbt-9.htm
Or you can pick your favorite site and plug in the ssid. Just dont waste your time with APRSWorld.

My UI-View station at the house will be left on for logging purposes.

Will be monitoring 146.520. Cant wait till i get back to 4 land even if it is for a short trip to home and back.

> Just dont waste your time with APRSWorld.

In Jim's defense (and he is a friend and business partner) APRSWorld was a college project for him and I am not sure he expected it to get as big and popular as it did. Having said that, he is pretty busy with day to day operations of his company and the "freetime" coding he gets to do is very little. I can appreciate this because I run a similar company, but I still have a day job with NASA and I only get stuff done for my company when I get home at the end of the day or on the weekends.

If you want a quick mapping link, I always like to use:

http://map.findu.com/kb7tbt-9

Of course just change the call on the above link to view any APRS station. Take off the SSID and add an asterik "*" to act as a wild card for a listing of all stations under that callsign, such as:

http://map.findu.com/ke4nyv*

Hope that helps. Have a safe trip. You'll probaly pass me on the VA Eastern Shore if you head up 13, through Maryland heading into DE and NJ.

6618. VP Oncore Slow To Acquire

Yahoo group: APRS (2007 — 2010)
Date: 2009-09-17 05:13:04 UTC
From: awaschka@bellsouth.net
Topic: 6618 Message: 6618

I've had a couple of Motorola VP Oncore 8 channel receivers laying around for several years. I'm finally trying to bring them up for use with APRS. I bought an interface board with batery backup from e-Bay and I am communicating with the unit. According to the manual it has acquired an almanac since it says how many satellites are visible. But even a momentary interruption in power causes a long period where no SNRs are displayed. The unit is putting out sentences, but they are just repeating the last position. I can't find anything in the command reference that would cause this, the only exception bbeing the application. I have changed from the default of land (30 minute timeout for cold start) to marine (two minutes) but that didn't seem to affect the performance. What am I missing?

Thanks,

Al

6619. ARRL/TAPR Digital Communications Conference Next Weekend

ARRL/TAPR Digital Communications Conference Next Weekend (Sep 17, 2009) -- ARRL and the Tucson Amateur Packet Radio Group (TAPR) will jointly host the 28th Annual Digital Communications Conference (DCC www.tapr.org/dcc) September 25-27 in Chicago. The DCC has something for everyone from those new to digital modes to those experienced with digital communications including technical and introductory forums. According to DCC Co-host Mark Thompson, WB9QZB, one of the highlights of this year's DCC will be Bob Bruninga, WB4APR, presenting "Universal Ham Radio Text Messaging." The Saturday night banquet speaker will be Bill Brown, WB8ELK, a pioneer in flying balloons with payloads including Amateur Radio digital communication technologies. Brown is the publisher and editor of Amateur Television Quarterly magazine. ARRL Technical Relations Manager Brennan Price, N4QX, will be on hand to discuss the upcoming World Radiocommunications Conference in his talk "WRC-12 Agenda Item 1.19: Shaping the International Regulatory Framework for Software Defined and Cognitive Radio Systems." QEX Editor Larry Wolfgang, WR1B, and ARRL Central Division Director Dick Isely, W9GIG, will also be in attendance. The 2009 DCC forum and speaker schedule is available
online http://www.tapr.org/pdf/DCC_2009_Schedule_Preliminary2009-09-16.pdf. TAPR provides leadership and resources to radio amateurs for the purpose of advancing the radio art and is a research and development oriented group offering kits, assembled products and publications related to the intersection of Amateur Radio and digital technology.

6621. Settings for local tracking a local bicycle race

Yahoo group: APRS (2007 — 2010)
Date: 2009-09-22 11:27:26 UTC
From: Jim Moody
Topic: 6621 Message: 6621

On Oct. 3rd there is a local bicycle race here. I am curious what experience has show to be the best tracker timing for vehicles following bicycles. We will be using one wide area digi for the race. As most of the ham voluteers are coming from a different area than here, I prefer to keep protocol changes to a minimum. But I can see a possible frequency jam if not controlled. Thanks for any input.

6622. Re: Settings for local tracking of a local bicycle race

Yahoo group: APRS (2007 — 2010)
Date: 2009-09-22 11:46:02 UTC
From: Jim Moody
Topic: 6622 Message: 6622

I forgot to mention a couple of the important aspects of the race. The sponsor runs three races concurrently, a 10, a 30, and a 75 over different routes. Therefore the requirement to track all three at the same time. Usually there are about 50 racers involved in this race to keep track of. The real bad part is our voice repeater died a few years back and with only a couple of hams in this area, it has not been replaced. We will be getting assistance from Hams within about 100 miles of here.

The digi-peater is mine. I am afraid of too much traffic on it and losing our ability to provide accurate data. Any ideas are welcome.

Jim,

I and another dozen HAMs just completed a 7 day bicycle event, Cycle Oregon. Our situation would be a little different than yours in that we did not have a local digipeater to work with and often did not hit an igate. However, the net control stations were able to receive our beacons and knew where we were. We tried using smartbeaconing with a 10 minute beacon when stopped and a 90 second beacon when moving at 60 mph. That gave a beacon about every 2 to 2.5 minutes when moving with the bicycles. However, later in the week we changed that to a fixed 2 minute beacon. Since the units were set up at different times, there was enough random spacing between beacons on the 11 vehicles we tracked so rarely did a station stomp on another. Our day covered from 45 to 85 miles and only two days had longer option routes.

This year we were experimenting with APRS on the event to see what coverage we would have out in the boondocks. The event travels on US Forest Service roads, BLM (Bureau of Land Management) roads, and what could be described as nothing more than paved goat paths where there was not room for a 15 passenger van and bicycles side by side on the road.

Same here! I always suggest fixed beacons because APRS in such an event with lots of trackers simply cannot be a "tracking system". It is a comunications system giving you at regular intervals, information on the APRS equipped stations. That information is not*just*position. It is position, plus, latency, plus activity, plus timing, plus network coverage, plus, plus, plus.

So I prefer to *know* what the transmit period is of all participants so that I *know* what to expect from the network. And therefore, can evaulate how the system is performing. This has little to do with trying to maintain a precise "track" on something that we alredy know the course on...

Having moving stations transmitting randomly at very random times and rates, gives you very little understanding about "how the network is performing"... As a communicator, that information is often more valuable then the exact "track"... Hence fixed rates makes the system deterministic and analyzable (in real time or after the fact).

Your mileage may vary.

6628. Re: so confussed about my HT

Yahoo group: APRS (2007 — 2010)
Date: 2009-09-25 12:54:04 UTC
From: RobertCGRO
Topic: 6625 Message: 6628

You have RFI issues, and it's not the GPS, it's most likely the TinyTrak causing the problem. That plastic case doesn't provide much in the way of RFI shielding. I normally make extension cables to keep the various components at least 2 metres apart, or you can put the TinyTrak into a metal housing, or as a test, wrap it in aluminum foil. Ferrite beads will be required in most cases if you can shield the TinyTrak or extend your cables.

The other issue is that HT's antennas are usually 1/4 wave (dummy loads on a stick) and need to work against a ground plane. Normally, it's your body holding the HT in your hand, but a way to ground can be found through equipment connected to the radio, since that's usually the path of least resistance. Best to add a 1/4 wave counterpoise wire under your antenna. This will not only provide a very low impedance path for the HT, but improve your transmit and receive as the antenna is now more like a dipole, and help to minimize RFI.

Tigertronics used to sell these as "Tigertails". Basically, a 19.25" length of insulated wire with an automotive crimp on ring to slip over your antenna connector, and then attach your antenna. SMA are easy but BNC's require cuting a notch or two to clear the teats.

This is the single biggest improvement that most HT users don't seem to know about. You can get 3dBd improvement for just a buck or two, if you don't have the parts on hand.

I've been using Garmin GPSrs since 1996 and never seen this in their documentation.

In fact, I've never found any information on this subject.

My first Garmin, a GPS-75 was used with an external antenna on the roof of my Land Rover Discovery. I had a 2m/70cm vertical.

Just over a year later the antenna failed and I returned it to Garmin UK. It was replaced FOC with a new one.

I do not know if my ham transmissions had any effect on the failure.

I'm now preparing for my small RV to have HF, 50, 144 and 430 and am interested in any experiences on how these antennas would affect my GPSr's and their external antennas.

I also have a couple of 75 watt solar panels on the roof and can't find any details of interaction with transmissions.

Reg

The manual that stated that was with my gps-17n when I got it in 2002.
I ended up mounting it 5' behind my vhf/uhf antenna for that purpose.

Reading the current manual all it says if you experiance interference
increase the distance between them.

I've got to way in on the smart beacon setting. I run an old HT for lack of anything else in the car. It's operating through a 5/8's wave on the trunk hood so it gets out. We live in a rural area. Smart beaconing is hit and miss on being picked up by the terrain but fixed time mode is most likely to catch a window where the signal is picked up. Things are different toward the city where there are more digi's and i-gates. My digi only works within 300 yards of the house towards town due to the rise but actually picks up miles from the house the otherway when you top out. Really lets you see the limits of VHF. would like to add about 20 more feet to my APRS antennna but currently it's in my attic and protected from the weather.

Same here! I always suggest fixed beacons because APRS in such an event with lots of trackers simply cannot be a "tracking system". It is a comunications system giving you at regular intervals, information on the APRS equipped stations. That information is not*just*position. It is position, plus, latency, plus activity, plus timing, plus network coverage, plus, plus, plus.

So I prefer to *know* what the transmit period is of all participants so that I *know* what to expect from the network. And therefore, can evaulate how the system is performing. This has little to do with trying to maintain a precise "track" on something that we alredy know the course on...

Having moving stations transmitting randomly at very random times and rates, gives you very little understanding about "how the network is performing". .. As a communicator, that information is often more valuable then the exact "track"...

Hence fixed rates makes the system deterministic and analyzable
(in real time or after the fact).

Your mileage may vary.

I would say moving it outside the attic would work excellent, even if not high. I used to run mine in the attic and could only get <.5miles of simplex range. It's not moved on to the tower, with +20' higher than it was in the attic, and I get good coverage all around, for about 10 miles now, and that includes about 2-3 miles on the other side of a hill that is 700' higher than me. These results where from using a comet CX-333 base antenna, and a SG7900 diamond antenna with 5watts (9.2watts ERP). It does get alittle bit more range, but this is pretty much the guarenteed coverage that isn't spotty range. I just put my 1/4wave antenna on the car today, so I will see what kind of coverage I get with it this week. Going be going through some drivethoughs, and the sg7900 isn't friendly for that.

From: Larry Simon
Topic: 6621 Message: 6636

From my experience in working with large events you are far better off with time slots. With stations beaconing every 3 seconds you can get about 76 slots beaconing every 4 minutes. You can see a slotting table at http://tracking.b2v.org/slotfiles/index.html. It was originally put together by a friend of mine, Phil, AD6NH. I have expanded it a bit and made a few minor adjustments, with assistance from Bob, WB4APR. It is also run on a private network to keep from congesting the national network until it enters the I-gates.

Subject: [APRS] Settings for local tracking a local bicycle race

On Oct. 3rd there is a local bicycle race here. I am curious what experience has show to be the best tracker timing for vehicles following bicycles. We will be using one wide area digi for the race. As most of the ham voluteers are coming from a different area than here, I prefer to keep protocol changes to a minimum. But I can see a possible frequency jam if not controlled. Thanks for any input.

Jim, NL7C

From: Jim Moody
Topic: 6621 Message: 6637

Thanks to everyone that has provided input to my question.

After considering all the information available I have decided to 'unproto' all the dumb trackers to my digipeater, therefore they will not be making it to any Igates and will only be local. I will set the dumb trackers to a 2.5 minute transmit time and start them with that in mind so as to cut the possibility of transmitting at the same time.

When the volunteers arrive I will go over the digipeating with them to keep problems to a minimum. Currently I see about 10-12 trackers total for this event. I do not believe at this level it will make any problems for the national system. It is training for future events here, after this race we hope to grow in size and assistance to the sponsor.

Thanks again to all,
Jim Moody, NL7C

Must be missing something, you either use a gps, or manually type in
your position. Though most radio's let you store 4 or so positions in
them that you can just switch between if you wanted.

~~~~~~~~~
This seems to be no problem if it doesn't affect anybody else. Recently, RAYNET assisted the Emergency Planning Unit, police and ambulance medics at a 10 km Road Race in north east England. The main facility was a voice network on 2m to pass messages between road junctions on the 10 km (6.25 miles) route which was closed to public vehicles for a few hours.

We also had an APRS network on a 70cm channel with 5 mobile rigs and also a hand portable APRS station shadowing the Chief Marshal. 5 of the APRS stations beaconed their location every 30 seconds, which would be quite anti-social on an APRS channel. The official race lead car, with a huge digital elapsed time clock on the roof, had a RAYNET operator in the passenger seat. He beaconed his position every 10 seconds.

At Event Control, the emergency services could see the location of key personnel at all times. We used the UI-View32 program with AGWPE to provide a street map, complete with allocated junction numbers (J1 to J86) to save RAYNET operators having to use long road names. The Emergency Planning Officer provided a projector to display the RAYNET laptop PC's map onto a white board.

APRS worked very well, as all 6 stations were in 70cm range of each other, so none transmitted on top of others.

6642. New add-on program for UI-View: UI-PHG-DFS

Yahoo group: APRS (2007 — 2010)
Date: 2009-10-02 15:02:37 UTC
From: richard611657
Topic: 6642 Message: 6642

The Windows installation zip file for my UI-PHG-DFS program has had 125 downloads. So far, nobody has reported any bugs. I expect to release version 1.0 in the near future. If you have any suggestions for changes or any bug reports, please let me know. The downloadable file is version 0.2

The program draws PHG and RNG circles. For direction finding it handles DFS and BRG/NRQ codes to draw DFS circles and BRG bearings on the UI-View map.

Unzip the file to a spare directory. Double click file setup.exe to start the Windows installation process. Download the zip file from:-

http://www.filefront.com/14592023/UI-PHG-DFS-V02.zip/

by clicking the yellow or gold icon marked "Download Now".

> ... setting up my KPC3PMX VERSION 9.1 ...
> ... as a digipeater, in an area that the
> closest digipeater I would guess is 40 to
> 50 miles away

Great! Here are my comments: Generally, you can do so much more with this digi. Please see www.aprs.org/localinfo.html and consider adding THREE local objects for the locally recommendd VOICE repeater for travelers and/or any OPEN echolink or ILRP nodes. These are very valuable to travelers...

> BEACON EVERY 10 min
> BLT
> 1 EVERY 00:30:30
> 2 EVERY 00:10:00
> 3 EVERY 01:20:00
> 4 EVERY 01:50:00

No, that is no longer the receommendation. Now we only use two of these for the digi, and the other two for local frequency objects. Please see www.aprs.org/fix14439.html near the top is a link to a KPC0.1 ROM settings...

>BTEXT KC0WNY-1 APRS Digipeater

That can be much better used as the 3rd local freq object...

>DIGIPEAT ON
>HEADERLN OFF
>HID OFF
>LT
>1 !3748.05NN09556.96W#PHG5130 Toronto,KS
>2 !3748.05NN09556.96W#PHG5130 Toronto,KS
>3 !3748.05NN09556.96W#PHG5130 Toronto,KS
>4 !3748.05NN09556.96W#PHG5130 Toronto,KS

Make two of these be local freq objects...

>LTP
>1 APN383 VIA WIDE2-2
>2 APN383
>3 APN383
>4 APN383

Yes, only ONE goes out WIDE2-2 and only once every 30 minutes...

>MYCALL KC0WNY-1
>MYNODE KC0WNY-1
>MYPBBS KC0WNY-1

Im pretty sure these have to all be differente calls...

>UNPROTO APN383
>UIDIGI ON WIDE4-4,WIDE5-5,WIDE6-6,WIDE7-7
>UIDUPE 30 (30 sec)
>UIDWAIT OFF
>UIFLOOD SS,30,ID

Set the "SS" to your state or ARRL section.

>UITRACE WIDE,30

Perfect.
thanks

Larry & all,

I finally got enough time to pull together APRS usage graphs for your biking even back in September. You can view the plots at:

http://ldeffenb.dnsalias.net.nyud.net/Tracking/BikePortland2009/*
(trailing * required)

Unfortunately, I dropped some of the data from the 14th, but the remainder came out pretty good. As always, you need to zoom in on the higher dash numbers to see the details and the -D-nn.PNG show only the beaconed positions.

Enjoy!

Lynn (D) - KJ4ERJ - APRS Infrastructure Analysis

> Jim,
>
> I and another dozen HAMs just completed a 7 day bicycle event, Cycle Oregon. Our situation would be a little different than yours in that we did not have a local digipeater to work with and often did not hit an igate. However, the net control stations were able to receive our beacons and knew where we were. We tried using smartbeaconing with a 10 minute beacon when stopped and a 90 second beacon when moving at 60 mph. That gave a beacon about every 2 to 2.5 minutes when moving with the bicycles. However, later in the week we changed that to a fixed 2 minute beacon. Since the units were set up at different times, there was enough random spacing between beacons on the 11 vehicles we tracked so rarely did a station stomp on another. Our day covered from 45 to 85 miles and only two days had longer option routes.
>
> This year we were experimenting with APRS on the event to see what coverage we would have out in the boondocks. The event travels on US Forest Service roads, BLM (Bureau of Land Management) roads, and what could be described as nothing more than paved goat paths where there was not room for a 15 passenger van and bicycles side by side on the road.

6646. TM-D700A and TH-F6A APRS set up

Yahoo group: APRS (2007 — 2010)
Date: 2009-10-06 00:03:35 UTC
From: Gene
Topic: 6646 Message: 6646

Hello to everyone in the group. I am new here, and also new to APRS. I am a communications supervisor with the Red Cross chapter here in Williamson County, TN and one of my responsibilities is inter-agency communications coordination during emergencies. Personally I am also interested in search and rescue, and am currently discussing the establishment of a county search and rescue team. I say all of this to not only introduce myself, but to request the collective intelligence of the group.

I have a Kenwood TM-D700A mobile in in my vehicle, and a hand-held Kenwood TH-F6A. I would like to set the the mobile system up for a dual purpose; one being search and rescue, and also for communication support for events my club provides comm support to, such as bike rides and races etc. The Th-F6A I would like to set up as a backpack remote search and rescue system in those cases where I would have to leave the vehicle for search purposes.

If anyone could please provide suggestions I would appreciate it very much. I know that there will possibly be a plethora of suggestions, but the more the merrier so that I will have as many solutions and courses of choice to follow. In advance, I thank all of you very much.

73,

Gene K4ARC

6647. TM-D710A for sale

Yahoo group: APRS (2007 — 2010)

From: David - KG4ZLB
Topic: 6621 Message: 6647

Kenwood TM-D710A For Sale.

Bought new in June 2009 ? decided that APRS is just not for me!

Comes complete with everything it came with plus:

Greenlight Labs GPS710 (attached to head unit)

PG-5G - PC serial programming cable 2m

PG-5H - PC interface cable kit

(These cables are not Kenwood OEM, they are cheaper copies bought on e-bay; they are unused and still in the bags)

Also a complete screw set and extra head mounting bracket purchased from Kenwood.

The radio has had absolutely no modifications and neither have I updated any firmware on the head or body units.

I changed the power leads to enable swift changes between the car and home; this can be easily changed to whatever your desired configuration might be.

Photographs available upon request.

I will ship this USPS insured and double boxed.

$550 if using Paypal

$525 by Money Order

Or very best offer!

David

6650. Help with COMS setup D710

Yahoo group: APRS (2007 — 2010)
Date: 2009-10-07 01:58:02 UTC
From: Joe
Topic: 6650 Message: 6650

I am trying to use the D710 with UI-View. What is the default TNC mode that APRS uses? In the UI-View Coms setup after chosing the D710, do I indicate Host "None" or "KISS"? Thanks and 73, Joe

Topic: 6646 Message: 6651

I'm not sure what you mean by setup, explain what you mean but at the least it seems you will need a second battery for the HT and the longer high performance whip from AES or HRO. Get a Water Proof HT.

The D700 could be setup to cross band repeat your low power HT signal to High Power on the opposite band. Thats easily done in the menu system. For example, your low power HT transmits and receives on 440 simplex to your D700 in the car which is repeating on high power to a 2 meter distant repeater. The opposite works too and there are other ways to do this but thats the basics.

Setting up your D700 mobile, well you might want the highest gain mobile dual band whip made by Comet or Diamond and use their high quality coax. Water proof everything. Use #10 cable to and from the radio direct to the battery and make sure PRO parts are used. If your mobile battery is old buy a new one then buy a second battery and install it. I can't tell you what size since I don't know what you drive so buy whatever fits and bolt it down. A second battery will power that 50 watt mobile for emmcomm all day since in my experience, the RX to TX ratio is 10:1, listening 10 minutes for every 1 minute of transmit, well maybe 20:1 so the battery will power the radio for 10-15 hours. If you think you'll chat more add a 43 watt Kyocera Solar panel and if more is needed, parallel another. Of course you'll need a solar controller ..... until it rains then solar panels are dead.

Make sure everything is water proofed, tight, best quality, best workmanship. Carry a couple of LED flashlights with a large pack of spare batteries, cold WX gear, rain hat .... I got stuck once with out cold weather clothes ..... buurrrrrrrrrr all night.

Yea, carry Powdered Chicken Soup, Tea/Coffee/Hot Chocolate and the makings .....

Of course the Grab n Go bag is very important, Google Emmcomm Grab and Go .... Always carry 50 feet of coax since you might be parked on the wrong side of a giant rock or bottom of a cliff ... and need to get the antenna out in the clear. I carry a small 2m/440 beam .

Clothes, some heavy duty snacks, medications, maps, quality GPS .... Good Training ..... sounds like you are ready to go .....

Ok ... well maybe this is not the info you were looking for .... Bill k6acj HBraces, Red Cross, CAlifornia ARES

I got on the wrong track ..... Since you might want to use the D700 for Cross Band Repeat put APRS on a separate 50 watt rig/antenna if you are out in the boonies, don't know anything about your situation but I do it here in SoCal. Anyway Rig#2 is good backup.

Make sure your GPS units are SIIRF III chip sets for the best performance.

Don't beacon every minute, 5 is plenty.

In SoCal we use WIDE2-2 for the unproto to digi into the IGATEs, you might have different requirements in your area.

6653. APRS for Scouts at JOTA!

Yahoo group: APRS (2007 — 2010)
Date: 2009-10-10 12:12:55 UTC
From: Bob Bruninga
Topic: 6650 Message: 6653

APRS mentors.

GET OUT on 17 Oct. Contact your local ham radio clubs and find out who is supporting a JOTA scouting activity in your area next weekend. Ask if you can take your APRS laptop and demonstrate it.

APRS can be used for JOTA for making contacts all over the world. APRS has a global JOTA CQ method so that your CQ JOTA message goes not just on local RF but also to ALL other JOTA stations on the planet.

To work JOTA on APRS all you have to do is send an APRS message to CQSRVR and use the words CQ JOTA CQ JOTA at the beginning of the message. This will put you on the CQSRVR server for 24 hours and forward your message to everyone else that has done the same thing.

From then on, you too will get every such loggon message from everyone else.

When you see one of these, then you have a callsign and then you can messsage DIRECT to that station, since APRS allows callsign-to-callsign messaging anywhere on the planet.

See www.aprs.org/cqsrvr.html

You can even do this from your APRS HT or D700/710. Show the scouts that HAM radio TEXT messaging works! You only need to enter two messages to QSO all day:

1) To: CQSRVR Msg: CQ JOTA CQ JOTA Troop XXXX in AL

2) To: CALL Msg: QSL! We are at Woodsmoke in FLorence

or whatever. Even though you only have your microphone keypad, all you have to do for each contact, is just RESEND message #2 and only change the CALL. Very easy to do from a keybad.

You resend message #1 once every 30 minutes or more (not allowed to send it globally any more often)...

Duh, scout kids KNOW HOW TO TEXT MESSAGE, and will love to see it work on Ham Radio!

Bob,WB4APR

Hiya Folks

Is it possible to modify existing equipement to get APRS to work on another frequency?

I can get the transmitters such as the Byonics AOI that can use another frequency, but was wondering what other hardware out there could be used too.

Of course, I'm still learning about APRS so this has probably already been asked before but I thought I'd try.

TIA ;) Elwyn

I have not used the GPS-710. In my neck of the woods, and in the vehicles I have or have to use, a unit that does not have clear view of the sky just does not work.

However, I have a Garmin GPS-16X-HVS puck. This may be a little overkill for most situations but it is an EMI/RFI hardened unit and will run with any unregulated voltage from 8 to 40 VDC. This is perfect for my plane and is just an example. I left the RJ-45 plug on the cable and made adapters to plug into either a Opentracker2 or into several other radios including a D710 and D700. I also have GPS-18x-LVC units, but I have found they are a little sensitive to RF when placed in close proximity (less than 3 ft) to an RF antenna.

That said, there are several GPS pucks on the market that have a NMEA-0183 format output. Try Byonics.com or ArgentData.com.

If you are looking for a GPS where you can display APRS stations, then, of course, there is the AvMap Geosat V.

Another option is a Garmin GPS unit capable of the Fleet Management Interface, such as the Nuvi 350, and use a GTRANS cable for the Kenwood D700/710 from ArgentData. I also have this setup and it works great.

The basic point is there are a LOT of options. It is just a matter of finding the right option for yourself.

I have several different setups for use on various events and I also loan out setups to those working with me on events.

Good hunting,

Larry

Hi,

If my memory is correct, I believe about $125 USD. I belong to the 710 group and I recall discussions before/during and after the design.

Don't quote me, but is was above $100 and less than $200, at least at that time.

I haven't bothered trying to lock my GPS-710 inside a lead box or a faraday cage, but on the other hand I have not found ANY position in the passenger compartment of my car where it fails to consistently get a 3D fix as fast or faster and as reliably as any GPS that I have ever tried.

6663. Re: GPS 710

From: k7ybz
Topic: 6657 Message: 6663

Under many circumstances, a GPS on the dash or windshield or anywhere in the passenger compartment will work. That was not my point. Here in the Northwest, one can travel through mountain passes which have in excess of 3000 ft hills above either side of the highway. Even my factory installed navigation system has lost contact with satellites and failed to give an exact location. That particular vehicle's GPS antenna is at the base of the windshield and dash and is only two years old.

If I am not using a GPS puck and I know I will be in an area with marginal satellite reception, I will put an external antenna on the roof of the vehicle. i.e. GA-25mcx for Garmin or the AvMap GPS engine for the Geosat V. That said, I will know where I am, but will probably not be able to transmit my location to an IGATE. An example would be on Cycle Oregon this past Semptember where there was no track of any of twelve vehicles for over 60 miles due to terrain between Yreka and Happy Camp California. Yea it was Cycle Oregon but we gave California some money. Do not ask me why!

I had not heard of the GPS-710 until the start of this thread, so I cannot and will not make a comment about it's functionality or reliability. However, after looking at the web site before making my post, it would have been an item to 'consider' for the tool box.

Topic: 6664 Message: 6664

I want to apologize in advance if this question is in the wrong group...regardless, hopefully some fellow member may have an answer...TU

My home location shows on static maps installed on UI-View 32, however it no longer shows up on the APRS.FI map...this just started in the last few days.

The home is being heard every 30 min on the static maps....on APRS.FI it indicates last heard nearly 2 days ago.

It has been appearing and signaling every 30 min, as programed, for the last several weeks following the initial install.

Really would appreciate any feedback. Sorry if this post is in the wrong group/site

Hmmm.... That is certainly NOT how your original post came across -- a person asked about where to obtain a specific make and model of equipment and you launched into a post of why that item could not work.

Sure sounded like "a comment about it's functionality or reliability."

Do you have UIview connecting to an APRS server or do you rely on your home station position being beaconed on RF and gated to the internet via an Igate?

Are you seeing other stations on your UIview map? Are they coming via the server UIview is connecting to or are they being heard over local RF?

6667. RE: [APRS] Arps using other networks

Yahoo group: APRS (2007 — 2010)
Date: 2009-10-15 13:41:19 UTC
From: Armour, Randy (ITS)
Topic: 6656 Message: 6667

A few transmit only APRS trackers are set one specific frequency. However, APRS can be done on any frequency that your radio(s) can transmit/receive on. Public service events, search and rescue teams, etc. often move to a frequency other than the common national frequency in the area. Doing so provides a clear picture of local resources without the distraction of APRS reports from units not directly involved in the event. It also allows for more frequent position updates since a small number of APRS units have the entire channel for their use.

High altitude balloon projects usually use a more "private" frequency since they have line of site to (and can hear) many other stations.

The short answer is that APRS itself is not frequency dependant. Just be careful not to choose an alternate frequency that will interfere with another service, like the input to a local voice repeater.

Randy - KI4LMR

Subject: [APRS] Arps using other networks

Hiya Folks

Is it possible to modify existing equipement to get APRS to work on another frequency?

I can get the transmitters such as the Byonics AOI that can use another frequency, but was wondering what other hardware out there could be used too.

Of course, I'm still learning about APRS so this has probably already been asked before but I thought I'd try.

TIA ;) Elwyn

I must admit, I am unsure on how I'm connected, since it was done by a fellow ham. Since this seems to be a critical piece of the puzzle I will get the correct answer vs guessing...

I will update this weekend or upon a definitive answer to the connection question.

6669. Re: GPS 710

Yahoo group: APRS (2007 — 2010)
Date: 2009-10-15 16:47:12 UTC
From: w2edv
Topic: 6657 Message: 6669

Hi,

Any NMEA-outputting GPS Rx will work. For example, with my 710, I have used (in order), 3 Garmin units: an old GPS III+, then a hh 60Csx and I currently use a 276c, which also handles my XM radio interface as well as XM weather. I have an external GPS antenna on my vehicle's roof, along with the Garmin GXM-30 XM antenna, which also plugs into the 276. All worked; the main advantage to me with the 276 is a fairly large map and the XM interface, so I could get rid of one control head in my car.

The current state of the art solution is the AvMap G5, although I think is overly expensive, although it is very tightly integrated with the 710 - it comes with a pre-made cable to connect the 2, allows for tactical APRS tracking and also uses the correct APRS icons when displaying them on the map.

My 276 also ran me $600, but with the large display and XM interface, I felt I was getting more bang for the buck, so I made my own cables and use a suction-cup windshield RAM mount. I don't normally use the 276 for driving directions, because it doesn't speak street names and it doesn't program as easily as the unit I do use for in-car nav, the Garmin Nuvi 680.

eham review said they were around $100. see if you can get a garmin 12xl off ebay (used as they don't make those either). they run on 12vdc and have nema out. you would have to mount it somewhere that it can get a satellite or put an external antenna on it.

And just to be extra clear, if the other frequency was outside of ham bands, it will need to use a type accepted radio for that band (in the usa atleast).

Yes, thank you Randy & Patrick.

The plan has surfaced as a way of tracking some equipment movement within a company. The plan is to use a commercial frequency and APRS like gear. Equipment are attached to rails, in a rural mountinous area and there would not initially be many. However if it works well for the company they could take it further.

I'm still a newbie with these things, but one day I'll get there ;)

Whoa! Way off topic!

APRS(r) is a registered trademarked products of Bob. B.

Any commmerical use of his product would require a license from his company. Par example: Kenwood and Yaesu have licensing arrangement to sell APRS enabled radios, et al.

Bob B. is the one to talk to about this issue, and not this forum.

Example:

LICENSE.TXT APRS LICENSE Copyright 1992-99
========== Document version: 8.2.7 Document dated: 11 Jan 99 Author(s): Bob Bruninga, WB4APR. LICENSE.TXT APRS LICENSE Copyright 1992-99
========== Document version: 8.2.7 Document dated: 11 Jan 99 Author(s): Bob Bruninga, WB4APR

President, Bob Bruninga, WB4APR. The owner reserves all rights and privileges to their use as detailed in the above license. Bob Bruninga, WB4APR President, APRS Engineering LLC 115 Old Farm Court Glen Burnie, MD 21060 Other licensed versions: WinAPRS is the official version of APRS for Windows by the Sproul bros MacAPRS is the Mac version of APRS also by the Sproul brothers APRS+SA is a special application by Brent Hildebrand for Delorme maps javAPRS is the java version by Steve Dimse APRtrak was donated to AMSAT who retains 100% of all proceeds MIRmon was a free version of APRS to encourage APRS use with MIR Kantronics Is licensed to limited use of the APRS Trademark PacComm is licensed to limited use of the APRS Trademark Kenwood is licensed to include APRS in the TH-D7A APRS data radio pocketAPRS is licensed to use APRS by Mike Musick xAPRS is under development by the Sprouls APRSdigi was developed by Wes Johnson APRSmon is licensed to use APRS Sightit is licensed to use APRS protocols APRSce is in development by the Sprouls CENON CENON CORP Tracker.

End Quote.

Not this again...

Bob owns the APRS trademark. You can't call something APRS or use his logo without his permission.

Bob holds the copyright on the APRSdos program. He can impose licensing restrictions ON THAT PROGRAM for people who choose to use it.

Bob (and maybe others) also holds the copyright to the APRS specification document. You can't reproduce it without permission.

Bob has no legal authority to control what you do with the protocol. You can set up a commercial tracking system on commercial frequencies (within the limits of the FCC rules, of course) and run Xastir or any other program that doesn't include a non-commercial use restriction in its end-user license agreement. You just can't market it as APRS(r) without Bob's permission. As far as I know, it's been many years since Bob claimed otherwise.

See Baker v. Selden, 101 U.S. 99 (1879) for more on the idea/expression dichotomy.

My apologies, it isn't in the catalog, but you can find it on the AES web site. Go to www.aesham.com and put Green Light Labs in the User Defined Search and that will bring it up.

Topic: 6680 Message: 6680

Hi Guys,

Anyone point me in the right direction re the regulations in the UK re putting a digipeater / Igate on the air in the UK.

Thanks

Peter

I ran APRS on the Kenwood D700 that is on our ARES trailer from the JOTA site today at Camp Miakonda in Toledo Ohio (http://aprs.fi/?call=W8MTU-2). I put out some CQ JOTA messages to the CQSRVR, but it seems like the Internet Gate to RF path back to my location was lacking. I was seeing my message getting digipeated out, but never received any acknowledgements or CQ JOTA messages back from the CQSRVR. If it wasn't for a direct message from KJ4ERJ in Palm Bay FL that I was able to QSL just before shutting down, it was looking like I was not going to have much more than a local contact. From checking with the packets logged and messages going through the APRS-IS, there were others that tried to reach W8MTU-2, and many previous calls from KJ4ERJ, but I only had the one message show up towards the end.

I also had a lack of Internet access, and brought the wrong cable for interfacing to the laptop, so didn't have a chance to do much else with APRS. I'm mostly just wondering if there was anything else I could have done from my end to get a better RF link to messages coming from the Internet.

We saw you (W8MTU-8). I saw that 14 people were logged onto CQSRVR (CQ JOTA). I was getting nothing, until I shot Murphy between the eyes after 2 hours.

Original D7/Laptop briefcase.. RX some, but TX NOthing, then brought out a D710 GO-kit, 50W and still not getting out. Receiving OK on Short antenna. Raised 65' mast with RG8 coax and antenna, still not getting heard...

Tried everything. Even digipeating from D7 via D710. Did not bring data cable for the D710. FInally removed a 4' run of RG58 provided by someone else, and everything worked great! BAD JUMPER CABLE! Last week it was a bad PL-259/BNC adapter. Before that, it was a bad antenna.. Lessons leard about TESTING EVERY OLD CABLE AND CONNECTOR before going to the field.

Oh, while digipeating via the D710 I simply used VIA TEMP1-1 (since all D710/D700's should permanently have that in their UITRACE path)... But still it wasnt being heard (see above). While doing some more tests with the D7 and a better antenna for it, I was getting Digipeated! THen realized it was still via the D710 without an antenna. Tuned it up 50 KHz or more (to avoid turning it off and losing settings).. later noticed IT WAS STILL DIGIPEATING! TUrned off the D710.. It was still digipeating!!!

Duh... no, it wasnt... it was my Car down in the parking lot... remember EVERY D700 and D710 should be a TEMPn-N digipeater... just for things like this... see www.aprs.org/TEMPn-N.html

Oh, it rained 24 hrs a day for th elast 3 days. It was a mess! Setting up and tear down in the rain. Whiped out two laptops with drips on the keyboards.

ANyway, once we solved the bad coax, we seemed to see other stations and did see you...

Bob, WB4APR

I'm glad I was able to get that contact through. I had left that one message in my Nuvi 350 having forgotten about a "feature" of the Tracker2/Nuvi350 combination. They BOTH do retries and the Nuvi doesn't seem to ever clear a non-ack'd message from its outbox. I had left the vehicle and got back later to find it still transmitting. I believe that problem is fixed n the latest firmware, but it's been a while since I pulled the unit out for upgrade.

I'm hoping to pull out a listing of my contacts from the logs when the weekend is over (it's hard to keep a list in the mobile). I know there were several here in the states along with one to Norway and one RF-IS-RF to Buenos Aires.

I interleaved the "honey-dos" with monitoring JOTA and was pleasantly surprised by the number of times the Nuvi was chirping out with tthe CQs. I just wish I could have sat there responding all day!

Lynn (D) - KJ4ERJ - (-12 is APRSISCE for Windows Mobile and -9 is the Alinco DR-135/T2-135/Nuvi350 mobile)

From: m6rkw
Topic: 6685 Message: 6685

So now i have theicom 2820 and im told this will get me up and running with the aprs bit..

You will also need a null modem cable (if you don't have one)

Shopping Cart
Quantity Item Price Total
1 TinyTrak4 Built and Tested with Case $75.00 $75.00
1 TinyTrak3 Cable M1P $19.00 $19.00
1 TinyTrak4 Cable M12P $19.00 $19.00
1 F-F Null Modem Cable $8.00 $8.00
Sub Total $121.00
Shipping To:International
Shipping:USPS Priority Mail International $15.00
Total $136.00

not sure on the null modem cable..

is there any place where i can read the setup of this lot?

i was speaking to someone on here who had the same setup but lost the contact.

We (operating at LA8V) had a couple of contacts, with USA and
Venezuela. A nice experience, as we had trouble with running two HF
rigs at that particular QTH, some 'net based APRS messaging contacts
was a good alternative. We had carried with us a mobile (i.e.
wireless, 450 MHz) broadband router with WiFi local LAN.

According to http://aprs.fi/?c=raw&call=URCALL&limit=50 it appears that someone was working on setting up something called "X-Digi". They probably had it misconfigured for a while yesterday but appear to now have it working right. It was digipeating packets and inserting its callsign which is why it was showing up "in everyones path". I suspect it had the wrong coordinates configured which is why it appeared to be 980 miles away.

If you know what the APRS landscape was before URCALL started showing up, keep an eye on it now and see what changes as that station gets itself properly configured, then you'll have an idea who it actually is. If it doesn't resolve itself, then you'll have to break out the direction finding gear and a good APRS receiver/decoder so you know which signals to home in on and just listen and search.

Unless any more experienced person has a better suggestion on tracking down a specific APRS station that is apparently beaconing incorrect coordinates?

Someone in your area has a new TNC. They forgot, or otherwise omitted, to program their call. These can show up as nocall, urcall, etc.

Good luck tracking them down.

I just re-read what I wrote and I didn't accuse anyone in particular of doing anything. I only commented that some station configured as a digipeater is using a callsign of "URCALL" on RF near K7CDL-14 even though the coordinates of that station (according to Ron) are 900+ miles away from the stations that URCALL is digipeating.

If you are running a station under the callsign of URCALL, then maybe you should use something more unique, or set your coordinates more correctly. If you're not running anything as URCALL, then nothing in my conjecture was directed at you.

Which -SSID are you asking about and what are the old and new
coordinates? For the KPC-3+ experts, they'll probably want to know the
new parameter values as well.

I see by the above unit, it can do aprs tracking but can be used as a tnc if I am correct. What does one have to do to use as a tnc from pc to the radio?, and cables involved.

It seems like a inexpensive way to go for the price.

TNX

POB

p.s. What do I need
the ttc4
cables ??to pc and to the radio..anything else

My experience with both the TT4 and the Tracker2 is that they work
really well for APRS, but have issues when used with connected packet
modes. Connected packet uses longer message lengths and frequently
transmits back-to-back packets which causes buffering and turnaround
problems in these lower-end devices.

As always, you're mileage may vary.

Lynn (D) - KJ4ERJ - Owner of both a TT4 and T2-135s

6702. Double APRS in a small box

Yahoo group: APRS (2007 — 2010)
Date: 2009-10-25 04:27:17 UTC
From: mcclickenstein
Topic: 6702 Message: 6702

Greetings,

I just uploaded 15 pictures of my double APRS "go kit" to the W7BRI folder under the Photos section (http://groups.yahoo.com/group/APRS/photos/album/597449812/pic/list).

To make the stuff in the case easier to point out, I made copies of 3 pix showing numbered items (detailed below), and included the originals in case the numbers make anything difficult to see clearly. Everything is crammed in a tight space and the numbers are relatively small, so I recommend that you view the images in large or original size in order to see the components.

I welcome your questions, comments and constructive criticism about this project.

Thanks & 73,

Brian Holmes
W7BRI
w7bri@...

PURPOSE:

My compact (23.2 x 19.2 x 11.1 cm) W7BRI 1150 case is a radio and packet modem integrated with a bluetooth GPS, FM transmitter and 2 port USB charger. It is a light-weight, versatile and redundant communication station that is ideal for EmComm (Emergency Communications) and SAR (Search and Rescue) work.

OPERATION:

Unlike most traditional packet radio setups that require a tangled mess of cords for modem, radio and GPS, you can access this one *wirelessly* with a bluetooth-enabled laptop. The serial-to-bluetooth adapter in the pack allows multiple serial connections from different sources; e.g., multiple people with different laptops and instances of AirMail, Paclink, etc. can use the pack in turn; the pack can connect to an ultra-sensitive bluetooth GPS and record its position/tracks; or, one person with GPSGate (http://www.gpsgate.com) installed can split/rebroadcast the serial data from the KPC3 packet modem or GPS to multiple sources -- to different programs, to other local bluetooth users, to remote people over the Internet, etc. With the pack's FM transmitter, many people can tune to a local, unused frequency on standard FM radios to hear what the pack is broadcasting.

SPECIAL FEATURES:

Redundancy, redundancy, redundancy... :)

The pack's Kenwood D710A has good built-in APRS features, limited packet capability and has a very accurate Greenlight Labs GPS-710 GPS attached (see below), but I integrated it with the Kantronics KPC3 Packet Communicator because it has independent APRS, much better packet capability (e-mail, etc.), and a separate GPS that is superior to the GPS-710 -- and can be used wirelessly. This "belt and suspenders" (or is it two belts or two suspenders?)

approach allows VERY accurate position reports, and uninterrupted operation/tracking if certain components fail.

Although the 1150 does not have an internal battery to power its Kenwood D710A radio, the Aircable Serial 3X bluetooth adapter, bluetooth GPS and Kantronics KPC3 Packet Communicator all have batteries that will continute to operate after external DC power is disconnected.

Currently, if the radio dies the KPC could only record tracks and queue up e-mails for later broadcast. To address this issue, I'm making different radio cables so I can use the pack with my HT, etc. (bypassing the D710A), and will probably get a PTT-capable bluetooth adapter from Aircable when it's available soon. I'm also considering integrating a compact, modular MicroTrack AIO (http://www.byonics.com/microtrak/mtaio.php) or similar transmitter with my 1150 pack.

All this in a case smaller than a shoe box. Not bad, huh? :)

NUMBERED PICTURES (see links in next section):

"external with console (numbered).JPG":

1) Comet SBB-1 antenna

2) 80mm x 15mm fan

3) D710A mic

4) Zip-Linq CAT6 retractable network cable

5) Bulgin IP68 PX0833 CAT5e shielded coupler

6) D710A console

7) Bulgin IP68 PX0833 CAT5e shielded coupler

8) Bulgin IP68 PX0802 panel mount connector

"KPC3, etc. closeup (numbered).JPG":

1) Right-angle metal D-sub hood for radio cable(modified to 180 degrees)

2) Blade fuse holder for D710A

3) Glass fuse holder for I-XT 12V to 5V USB charger

4) Right-angle metal D-sub hood for serial cable (to bluetooth adapter)

5) Bulgin IP68 PX0802 panel mount connector

6) Glass fuse holder for KPC3

7) My version of a Red-Dee-2 PS-4 PowerPole splitter (http://www.reddee2.com/Products/PS_4.htm). It consists of 2 sets of red/black PPs that have been cut short; bare copper wires from the positive poles were twisted together, as were the negatives. +/- were separated by multiple layers of electrical and heat shrink tape, and the resulting adapter was bent into an "L" shape for maximum compactness. Sorry,

it's very difficult to see and would be even harder at this point to extricate from the case. I'll post a better pic eventually...

8) Kantronics KPC3 Packet Communicator

9) USB charging cable for Serial 3X bluetooth adapter (see blue shrink tube on black cable in upper left of pic)

10) USB charging cable for GlobalSat BT-359W bluetooth GPS (see green shrink tube in upper right)

11) Bulgin IP68 PX0802 panel mount connector

12) I-XT dual USB charger with modified PowerPole end (80mm fan power (yellow shrink tube in upper right) is paralled with source power cable that connects to my version of the PS-4.

13) KPC3 to D710 cable (originates at #1)

14) D710A bracket. Industrial velcro on the bottom and silicon heat pad on the top seem to provide adequate space, cushioning and heat protection between the radio and modem. Tests are ongoing...

"top & bottom showing radio, etc. (numbered).JPG"

1) Aircable Serial 3X bluetooth adapter

2) Straight metal D-sub hood kit (cut short)

3) Bulgin IP68 PX0833 CAT5e shielded coupler (for mic)

4) GlobalSat BT-359W bluetooth GPS

5) 80mm x 15mm fan and grill

6) Philips Transcast FM transmitter

7) Kenwood TM-D710A mobile radio

8) KPC3 to D710 cable

9) I-XT dual USB charger with modified PowerPole end

10) Male to male UHF adapter coupled with female to female UHF adapter through Bulgin bulkhead

11) My version of the PS-2 PowerPole splitter (sorry again).

12) Bulgin IP68 PX0802 panel mount connector

13) Bulgin IP68 PX0833 CAT5e shielded coupler. If you look close, you can see the RJ45 jack coming out of it. It's actually two jacks crimped end-to-end with a rubber ring between them. This snaps right into the D710's console port...

My packet experience has been positive. I used the older KISS firmaware load for about 18 months with Winlink packet and have used the newest firmware as well. The paclen in AGWPE is set to 128 but its easy enough to use 64 or 256 depending on band conditions.

Use a PC modem cable from the PC to the TT4, TT4 Pins 2,3 and 5(grnd). The Radio cable is the same for APRS just make sure the 1200 baud radio data pin is used.

AGWPE setup for KISS connects to the radio
WinPack packet terminal connects to AGWPE.
The changes to AGWPE is documented in this list server. Begin by setting up AGWPE for the TAPR2 TNC the inspect the INI file and modify.

This is certainly a compact and interesting kit. Perhaps it's because I don't have a lot of EmComm or SAR experience, but I'm not sure how it would be used in practice. As a beacon? As a Digi? As a communications hub? All of the above?

I'm trying to visualize it in context. When you get a chance, it would be interesting to see it in field use.

One concern I'd have with packing everything in a pelican case is that from the outside, it looks like it might be more shock resistant than it actually is. Pelican cases seem to invite a certain amount of rough handling.

Thanks for posting!

Interesting. Looks like something I would be interested in making.

Question: I wonder why you chose the Pelican box? Obviously, the way you have modified it, it is no longer water or dust proof. So why use it? What's the thinking there?

Graeme,

I used a Pelican case because it's one of the toughest and best made. I've used them in all my other mods and know a couple places to get them relatively cheap. Also, I already had a couple Pelican 1150s that I used for prototypes in other projects, so it was easier to re-task them as a template for this project than buy a new case from another manufacturer without knowing in advance whether or not it would work for me.

Yes, I reluctantly compromised the case by putting an uncapped hole in it (fan), but since I packed the radio, KPC3, etc. so tightly I felt I didn't have much choice. I've operated the radio and a 10.5AH battery in a larger, sealed Pelican 1300 case without problems -- but I didn't want to push my luck with the 1150.

In any case, the pack is still impact-resistant and the components will survive small splashes that don't get through the 80mm fan hole. When the pack is powered up the fan is on, so I'm not worried about dust; when it's off, it's usually packed up in another bag or case.

73,

Brian
W7BRI

Bob,

In a pinch, it could probably be used for all the above -- but I don't know yet how it well it would handle different modes of operation. So far, I've only had the opportunity to put it on the floor of my truck and use AirMail on my laptop in the passenger seat.

Soon, I'm going to drive around with both GPS's, etc. going simultaneously and then check position reports on findu.com and aprs.fi to see how they compare.

Next, I'm going to find a few people with bluetooth-enabled laptops and have them do some round robin connections to the pack; then, I'm going to see if GPSgate will let me split the connection from the KPC3/GPS to all of them simultaneously.

Like I said, tests are ongoing...

The case is fairly shock-resistant, but the stuff inside isn't. :) Although I wouldn't want to drop it, the pack and components should be OK with getting bumped around a little. For transport, I'd probably put it inside a bigger Pelican case like a Russian nested doll.

It is a light-weight, versatile and redundant communication station that is ideal for EmComm (Emergency Communications) and SAR (Search and Rescue) work.
> >
> >
> > OPERATION:
> >
> > Unlike most traditional packet radio setups that require a tangled mess of cords for modem, radio and GPS, you can access this one *wirelessly* with a bluetooth-enabled laptop. The serial-to-bluetooth adapter in the pack allows multiple serial connections from different sources; e.g., multiple people with different laptops and instances of AirMail, Paclink, etc. can use the pack in turn; the pack can connect to an ultra-sensitive bluetooth GPS and record its position/tracks; or, one person with GPSGate (http://www.gpsgate.com) installed can split/rebroadcast the serial data from the KPC3 packet modem or GPS to multiple sources -- to different programs, to other local bluetooth users, to remote people over the Internet, etc. With the pack's FM transmitter, many people can tune to a local, unused frequency on standard FM radios to hear what the pack is broadcasting.

> >
> > The pack's Kenwood D710A has good built-in APRS features, limited packet capability and has a very accurate Greenlight Labs GPS-710 GPS attached (see below), but I integrated it with the Kantronics KPC3 Packet Communicator because it has independent APRS, much better packet capability (e-mail, etc.), and a separate GPS that is superior to the GPS-710 -- and can be used wirelessly. This "belt and suspenders" (or is it two belts or two suspenders?) approach allows VERY accurate position reports, and uninterrupted operation/tracking if

certain components fail.
> >
> > Although the 1150 does not have an internal battery to power its Kenwood D710A radio, the Aircable Serial 3X bluetooth adapter, bluetooth GPS and Kantronics KPC3 Packet Communicator all have batteries that will continute to operate after external DC power is disconnected.
> >
> > Currently, if the radio dies the KPC could only record tracks and queue up e-mails for later broadcast. To address this issue, I'm making different radio cables so I can use the pack with my HT, etc. (bypassing the D710A), and will probably get a PTT-capable bluetooth adapter from Aircable when it's available soon. I'm also considering integrating a compact, modular MicroTrack AIO (http://www.byonics.com/microtrak/mtaio.php) or similar transmitter with my 1150 pack.

It consists of 2 sets of red/black PPs that have been cut short; bare copper wires from the positive poles were twisted together, as were the negatives. +/- were separated by multiple layers of electrical and heat shrink tape, and the resulting adapter was bent into an "L" shape for maximum compactness. Sorry, it's very difficult to see and would be even harder at this point to extricate from the case. I'll post a better pic eventually...

Brian,

I do not see the fan's compliment air port for air flow. If the fan is set for exhaust from the case, you should have an air inlet port for fresh air otherwise it makes no sense to operate with the case closed. If you are just relying on the fan hole for incoming air, thats not efficent.

Norvac does have the fan filters with a blade guard combo.

Larry,

Thanks for your input.

Ideally, I'd put two fans on the case like you described: one pulling cooler air from the outside and one on the other side of the case pulling hotter air out; however, the tight space made that very problematic.

The only spot a small inlet fan could be mounted is on the antenna side right over the white USB charger. I considered installing one, but decided to wait and see if my current setup was sufficient. It seems to be working great and blowing out warm air as intended. I think it's able to do this because of the following reasons: 1) I didn't seal around the PowerPole jacks, 2) There's little holes in the CAT5 jacks, 3) I left a empty spot right over the D710's outlet fan, so when it blows out hot air from the radio the only channel for it to go when the case is closed is right into the path of the 80mm fan, and 4) I operate the pack with the fan side up, so it takes best advantage of the naturally rising heat.

I'll check out those fan filters, but other ones I've tried reduced the CFM by an unacceptable amount.

Brian,

You wouldn't have to go so far as putting in another fan. I would suggest using a hole say 1" to 2" in diameter and cover the hole with one of the fan filters. Norvac in Beaverton had the filters from 1" to 6". If you put a filter on the fan attached to the lid, you could replace that fan with a higher CFM rating instead but you probably don't need that. Just filtering the air coming into the box should be sufficient.

If the air coming out in the current setup is hot, then that is a good indication you do not have good air flow. At worst case it should be no more than a little over ambient.

I am going to be making a similar package, but I chose the flip top metal catalog case from Harbor Freight to start with. I got mine for free because of a screw up on another order. I haven't measured everything out yet but I am concerned the case might be too narrow for the setup I want.

Good idea. That would fit better over the USB charger than another fan. Right now, the air coming out of the case doesn't feel hot -- but I don't have a good feel for relative temps. I found a cheap digital thermometer with temp probes on newegg.com that I'll use to compare the internal temp vs the air coming out vs the ambient.

Do you have a link to the flip-top case you got? I've used these for power packs:

http://www.pelican.com/cases_detail.php?Case=1430
http://www.pelican.com/cases_detail.php?Case=1440

That's about the same size as the Pelican 1430 -- one of my favorites. I really like the 1430's 59lb bouyancy rating, the boat brackets and other accessories you can get for it. Also, I tend to prefer plastic cases over metal due to condensation concerns. YMMV.

> > > >
> > > > The only spot a small inlet fan could be mounted is on the antenna side right over the white USB charger. I considered installing one, but decided to wait and see if my current setup was sufficient. It seems to be working great and blowing out warm air as intended. I think it's able to do this because of the following reasons: 1) I didn't seal around the PowerPole jacks, 2) There's little holes in the CAT5 jacks, 3) I left a empty spot right over the D710's outlet fan, so when it blows out hot air from the radio the only channel for it to go when the case is closed is right into the path of the 80mm fan, and 4) I operate the pack with the fan side up, so it takes best advantage of the naturally rising heat.

6716. Re: interface Garmin 530 to Kenwood D700A

Yahoo group: APRS (2007 — 2010)
Date: 2009-10-28 00:40:31 UTC
From: k7ybz
Topic: 6713 Message: 6716

Jeff,

I am going to assume you have a Garmin Rhino 530. It will work with a D700 but you need the USB to serial cable, Garmin part number: 010-10572-00.

You will have to remove the DB9 connector and wire in a 2.5mm stereo plug or make an adapter from the DB9 to a 2.5mm stereo plug for use on the D700.

Since the output from the Rhino 530 is NMEA, you can use with a lot of devices.

6717. Nuvi 350 and OT2m as mobile, what do you all think?

Yahoo group: APRS (2007 — 2010)
Date: 2009-10-29 05:02:10 UTC
From: Ron K7CDL
Topic: 6717 Message: 6717

this is for people that already use this setup. i'm thinking of changing my setup. right now i have a Rino 130 hooked to TT4. not saying anything bad about TT4 but i have a Nuvi 350 that is new and i'm so ready to upgrade and use that so i can see other aprs stations when driving the semi truck i drive. my main reason for emailing the group is to see what problems you all have had with the Nuvi 350 and OT2m setup as a mobile setup? how many of you do messageing on them? i stop a lot in the middle of nowhere where there is no cell phone service but there is great aprs service. please let me know about all the good and bad that you all have had about this compian setup. i have a GTRANS Garmin to NMEA Translator Cable (D-Sub Style) on order but really thinking about seeing if i can change my order fo the OT2m type of setup.
thanks,
73s

>is there anyway to call CQ on aprs messaging as there isnt many people around here thats doing aprs messaging?

Enter CQ in the To field of your APRS application (and some text if
you like). Those who are around with APRS, will receive your message.
But if you are nowhere near a digipeater or IGATE, your message won't
go far...

>need help because of very bad weather

If you need gear to call for help where there is no cell phone service
and also out of range for VHF, I'd think that either a HF mobile rig
or a satellite 'phone would do the job...

From: Lynn W. Deffenbaugh (Mr)
Topic: 6718 Message: 6720

There's a CQSRVR service which maintains "groups" of people with APRS messaging that are interested in answering CQs. When you send a message to a specific CQ "group" via CQSRVR, it is instantly sent to all currently registered members of that "group". Sending such a message also makes your call-SSID a member of the "group" for the next 12 (or is it 24) hours.

For general CQs, I send the following message to CQSRVR via APRS messaging:

"CQ CQ from Palm Bay, FL USA"

CQSRVR responds with a message to me saying how many members my message was sent to.

The second CQ is actually the group name in the generic form:

CQ <group> <your greeting>

You can read all about it at http://www.aprs.org/cqsrvr.html and http://www.aprs-is.net/CQSrvr.aspx

However, anything you read about needing to say "CQ <group> CQ <group>" is obsolete. CQSRVR was recently updated to automatically include the first "CQ <group>" in the outbound message (thank you Pete!)

Lynn (D) - KJ4ERJ - APRS CQing as -9 (T2-135 mobile rarely), -12 (APRSISCE) and/or -15 (laptop)

I haven't installed this in my car, yet, but I put together a Nuvi 350 with the Tracker 2 and it worked right out of the box(es). It was about 10 minutes from unpacking to receiving waypoints on the Nuvi.

As far as messaging with this system, I've tested the messaging between the Nuvi/T2 and a laptop running UIView and my VX-8R and it works as advertised. Like I said, I havent' installed this in my car (yet), so I can't comment on how well this works in the field. My only complaint is that the Nuvi uses a alphabetic keyboard so it's hard for me to find the letters quickly. What's cool, is that you can configure the T2 from the Nuvi so you don't need to connect a computer to change things like the comment string or other configuration parameters.

My experience with APRS messaging, so far, isn't that consistent. Radio to radio seems to work as well as reception allows. Messages from the internet to RF don't always get sent nor are they always received (when actually sent). I'm not sure why that is. It could be my setup or it could just be an artifact of the APRS system. I'm still figuring all this out.

But, even for a newbee, the Nuvi350/Tracker2 system is about as simple and straightforward as they come. With a good radio/antenna, you should do well.

I have been running a 350 and OT2 for several months. I HIGHLY recommend the combination. That is unless you can afford the Kenwood and the matching large screen unit that goes along with it.

But for the money, the 350 OT2 does everything I could ever ask for. It would be nice to have a large screen but it's not a big deal.

Hi Steve,

Funny bumping into you here!

No problems with setup at all. Plug and play as I remember.

It is so sweet to be able to "see" the stations around you plus still be able to use the 350 as a driving aid. Best of both worlds.

I couldn't image being on APRS mobile and simply spitting out my position for everyone else to see and not know who was there. It would be like disconnecting the speaker from your radio and only having a microphone. What fun would that be?

I usually take the laptop with me when I go mobile and run UIview. I've been
wanting to change my setup here. I have a great (and old) 2M handheld I
think I am going to pair up with one of those little add on TinyTrackers or
the other one, so I can leave the D700 @ home. That Nuvi aught to fit right
in. Small and easy.
I look forward to talking to you on the air Randy.

Steve,

Thanks for the link, but I already get most of my Pelican cases from that cases4less site. You can get them pretty cheap compared to other places if you select the no foam option. If you don't see the models or accessories you want on their site, you can usually buy them anyhow if you give them a call. :)

73,

Brian

I purchased a group of cases from cases4less a few years ago. Very
happy with the price.

for info: I found the other case http://seahorsecases.net/ maker I was
looking for... if you search seahorse (made in USA) - there are a
number of distributors around US http://www.seahorse.net/distributor.aspx .

6746. Re: [ScoutRadio] APRS at the 2010 BSA Jamboree?

Yahoo group: APRS (2007 — 2010)
Date: 2009-10-31 14:32:25 UTC
From: Bob Bruninga
Topic: 6746 Message: 6746

We really do need to get going on firm planning for APRS at jamboree 2010. The most important part will be identifying those people that are APRS savvy and will be there.

> * Will the APRS [digi]peaters outside of the
> Jamboree be able to handle low power hand held
> APRS from the Jamboree?
> Did anyone do this in 2005?

We will need to install one-or more on-site digis for handheld coverage. But that is as simple as a few mobile D700s parked in a few places or some small portable digis.

> * Thinking ahead... what would make a
> nice APRS demo for the boys at the
> Jamboree? (send an email home?
> would they care it was via APRS?
> -- radiograms are sent out every day
> mostly via packet)

When we identify all the APRS hams that will be there, we must also find how many of them can bring along a tracker device or 2-way APRS HT. There just may be enough of them to provide some fun tracking of existing people as the move around.

But sending Email FROM THE HT out in the field or in the subcamps to mee is the killer-ap...

Maybe prepare a FLAG that is UNIQUE to APRS that indicates THAT FLAG or bearer is being tracked over at K2BSA? Or an OVERSHIRT saying "See me on APRS.FI" See ham radio!

For some reason the email never made it to the APRS group...

I talked, via email, to the Jamboree K2BSA chairman and he is receptive to having a APRS repeater on site. I am also on the K2BSA staff would like to see APRS represented at the Jamboree. Having a repeater on site should provide HT coverage. I still would like comments - I am new to APRS. I am thinking on using a 10 watt rig and a Kantronics KPC3+ // <http://www.kantronics.com/products/kpc3.html>TNC with a 3db antenna near the center of the Jamboree (merit badge midway?).

From: Stephen M. Shearer <wb3lgc@...>
To: APRS@yahoogroups.com, ScoutRadio@yahoogroups.com

I am trying to plan my radio usage for the 2010 BSA Jamboree next year (Christmas is coming). I know a VHF and UHF FM repeater is part of the K2BSA operation. I am looking at APRS HT's as a way for my son and I to keep in touch and to keep in touch with my wife and older son not at the Jamboree. [YES we are all licensed] I have been using a mobile rig in the car with APRS, so I know what it will do. I found an old - not up to date - web site of the 1997 Jamboree (see below), but the graphics are gone and I am sure it would be out of date.
http://aprs.org/jamb.html#MAP - was for the 1997 Jamboree.

* Will the APRS repeaters outside of the Jamboree be able to handle low power hand held APRS from the Jamboree? Did anyone do this in 2005?
* I don't (currently) know of any APRS repeaters ON the Jamboree site that would operate with the hand held radios that may be in use. The K2BSA tent (and site of the voice repeater) would not be the best location for an APRS repeater... Does anyone (going to the Jamboree) have a nice secure location with air conditioning?

* Thinking ahead... what would make a nice APRS demo for the boys at the Jamboree? (send an email home? would they care it was via APRS? --

radiograms are sent out every day mostly via packet)

The specs do not show the Nuvi 200 as being capable of outputing any GPS data through the mini USB port, either GARMIN or NMEA, so you are out of luck for APRS with this unit. The port only supports the mass storage function which allows you to upload routes and points of interest to either the unit's memory or to the optional SD card.

Allen,

I believe the Garmin 60csx is going to be your best bet. Both serial and USB interfaces on the backside.

Paulus,

That looks like a pretty nice marine navigation system, but I am looking specifically for a handheld unit. (For a dash-top, I would use the Avmap G5, since its really the only unit made to work with APRS anyway) Thanks though!

The Colorado and Oregon series have NMEA, but only if you get the (kind of pricey) cable. It's got a big voltage regulator / RS-232 transceiver lump inline. Works great with the Tracker2, though.

My favorite is the Rino 530HCx. Like the Colorado, Oregon, and Dakota series, it needs a special cable (though different from the one used for those three units) in order to get access to the RS-232 port. It has the high sensitivity receiver, a micro-SD card slot for plenty of map storage, color display, and the FRS (and GMRS and WX) radio with position reporting including the ability to send and receive waypoints and short messages with other Rino users so it's also useful when you're working with non-ham folks.

Allen,

Remove the bracket and a 276c becomes a handheld unit ;)
With 6 hrs battery life to boot.
This unit has 2 modes: automobile or marine.
Another plus point: availability of detailed map covering the whole world.
Serial cable (it has 2 real serial ports) comes in the box, no need to purchase additional pricey cable.

Paulus,

I will take a second look at that unit. I am not sure that a 6 hour life span would be sufficient. My reason for asking about a handheld, is that I have had a lot of people ask me about producing a transceiving version of our Micro-Trak AIO. Just having an OEM GPS module inside seems like a real waste. It would still operate as a tracker and a digipeater, but I would like to find a reasonable cost handheld unit that we could assure our customers would be reasonably functional with a TT4- based Micro-Trak.

From: rrath
Topic: 6760 Message: 6760

Every time I download WinAPRS I can not open it due to no maps. So I click on the prompt "maps folder missing". Then another prompt "no map files were found". Then I click on the OK for the unregistered version window. Then another prompt "unhandled exception: c0000005 at address: 7752c315". Then prompt: WinAPRS has encountered a problem and needs to close". Then I loose WinAPRS as it closes. Can some one give me some help on this? Thank you.

I used WinAPRS for years and have downloaded many of the USGS maps. Without doing any setup, does the program display the USA map?

Do these folders exist:
/winaprs/maps
/winaprs/tiger Tiger will be empty, we will fill it with USGS maps later if they are still available online but I have them for the Los Angeles area.

From: Wayne
Topic: 6767 Message: 6767

I am in the process of joining the TNC-x group but thought I would ask the question here.

I am trying to help someone set up a TNC-X with the digi board installed. Rather than trying to re invent the wheel so to speak I need the parameters for a wide2-2 digi. Specifically configuration menus:
C
A
F
L
T
M
1 THROUGH 8
D
B 5 THROUGH 8 for a 10 minute interval between beacons

Any help is appreciated.

Hi Brian,
well i need a box like you have do you know where i could find it,,,on
Ebay??i dont know how to name it?
i need one if possible with isolation inside,it is for my Aprs station in my
skidoo this winter and the temperature goes below -30 celcius often.
could you gave me a tip please,by the way your install is great,,,and the
fan it is a great idea too .it need too take the heat out of the box and
with hole around the case fresh air would go inside.

Gervais,

For an insulated box, you will have to put that together. I suggest purchasing a case, Pelican or otherwise, without the internal foam. The foam will give you some insulation, but not much. Then put hardcore insulation inside. The hardcore wall insulation, normally used in house basements, is available in 1" to 4" thickness (2.5cm to 10cm for the metric folks) depending on the insulation properties you will need. You would just need to increase the inside dimensions to accomodate whatever you put in.

However, you may have a different problem and would need to think this out a little more. The moment you cut a hole in the case for ventilation, you just compromised your insulation properties.
You 'might' get away with drilling a couple of small holes to draw outside air in and a couple of small holes for exhaust if the radio's fan (if it has one) can handle the airflow.

What do you have in mind for using as an APRS station?

I have used a handheld under the coat in temps down to -50C, but not a mobile.

Here are couple of web sites, but there are others.

You could get around that problem by mounting a heatsink on the
outside of the case, I wonder how well to run some heatpipes from your
radio to the external heatsink. You could seal the heatsink to the
case to keep it waterproof.

The problem then again is insulation, the heatsink will let the heat
out of the box, but it will also suck the cold into the case.

(glycol cooling? only run the pump when the inside glycol gets above temp?)g

From: k7ybz
Topic: 6702 Message: 6771

It may be a non-issue anyway, depending on if he is using it for voice or just APRS. With the low duty cycle on APRS, and for that matter occasional voice, there should not be all that much heating and what there is could be used to keep the other components warm, at least into the commercial temperature range above 0 degrees C.

I would probably start with just the insulated case and put sensors inside. Then beacon telemetry along with the APRS and check the data later. From that make any adjustments necessary.

From: joe
Topic: 6773 Message: 6773

I used to be a volunteer at a local childrens science museum several years ago. I recently stopped by to see a friend who works there now. Same old exhibits. This got me thinking about putting together an exhibit on ham radio, or radio in general. Display some crystal radios, some old style tube radios, maybe a shortwave band radio that visitors can tune themselves, a morse code setup between a couple of "stations" in different locations in the museum. I need to find out about their internet connection and maybe set up ui-view on a computer for APRS.

Anyone done this before? Ideas?

i was going to do something similiar at our local historical museum but never got the chance due to the museum possibly closing (long story). as part of the exhibit i was going to kids and parents together and actually constuct crystal radios. we were also going to have an HF special event station.

Morning all,
How hard is it to send messages with a D710 and Avmap G5? Was thinking about adding a laptop into my truck but if the messaging can be done via the G5 it would just be easier to add it in instead.
Thanks for the info in advance.

Peter Dakota Summerhawk-N0WRE

You cannot message with the G5, or for that matter, from any other GPS when attached to the D710. However, you can message fairly easily from the D710 itself or from an attached PC.

Yes you can, however, the OT2 would be a duplicate to the internal TNC of the D710 and it really defeats the purpose.

You can connect the Nuvi 350 to the D710 with a GTRANS cable from Argent Data, but messaging is not available in this setup. Neither the Kenwood nor NMEA protocols have messaging capability.

Peter that's also the way ahead for me.

A few years ago when I received my Garmin 2610, I discovered that it only had a USB port and not a serial port. Therefore I could no longer download my track logs to a Psion computer anymore. Nor connect it to my D-700e. I quickly bought a secondhand Toughbook CF-71. It arrived very scratched and battered, but it's still working very well, although it only has W98SE. I understand that XP is not suitable.

I'm now waiting for the secondhand CF-19 Toughbook that I ordered on Saturday to arrive. Then I'll install my APRSPoint on it. So I'll also be back to having a touch screen as on the Psions.

Now, should I upgrade the 700 to a 710 and buy a G5?

Reg.

I have a suggestion for sending messages through the TH-D7/D700/D710 and its only a suggestion but it works fine, ditto as a KISS TNC for WinPack/AGWPE and WinLink Mail. Set the D7xx to TNC mode for a PC connection and run WINAPRS. This will give you APRS, GPS, Maps, Text Messaging. WinAPRS will run in terminal mode or in KISS mode.

Winlink mail works with the above Radios but only the D710 has sufficient internal buffer space for reliable messaging. The TH-D7 and D700 internal TNCs will crash forcing a full RESET. Better back up your settings before trying the above.

Oh well, only a suggestion ..... Bill k6acj

6784. D710 Email/SMS receive capabilities

Yahoo group: APRS (2007 — 2010)
Date: 2009-11-16 14:24:01 UTC
From: James Garner
Topic: 6784 Message: 6784

I want to mount a D710 on my motorcycle. One obvious reason is APRS tracking so my wife can make sure I am not riding anywhere that I would get into trouble. (I guess Vegas is out) Emergency beaconing is also a good thing.

Is there a way for me to receive either a short email or an SMS that will display real time on the screen of the D710? I am not interested in trying to reply or anything dangerous while riding. I am looking for the "Phone Home Now" type of message that can be sent via email or SMS.
Currently I receive them on my phone. I only check my phone every 2-3 hours when I get gas.

Any suggestions would be appreciated.

any APRS client should let you do that; I know that UI-View will work
that way.
Caution when trying to run a TH-D7 from an application in KISS mode
(according to lots of feedback in the UI-View list about that some
years ago)

6788. Help with packet bounce between Digi's

Yahoo group: APRS (2007 — 2010)
Date: 2009-11-20 22:15:15 UTC
From: Wayne
Topic: 6788 Message: 6788

In our area a number of digi owners feel we may be headed down the path that other areas have with channel congestion to the point where the system is unusable at times. Here is an example of bounce from four digi's that are on mountain tops 50 miles apart. I have changed the call to protect the user who is wide3-3. However we see the same thing from people running wide2-2.

N5###-9>ST4Y9P,LTROCK,MTIDA*,WIDE3-1/2: <UI>:
`x-|l!s>/"5j}
N5###-9>ST4Y9P,LTROCK,K5CS-12,MTIDA,WIDE3*/2: <UI>:
`x-|l!s>/"5j}
N5###-9>ST4Y9P,LTROCK,HOTSPR*,WIDE3-1/2: <UI>:
`x-|l!s>/"5j}
N5###-9>ST4Y9P,LTROCK,MTIDA,HOTSPR,WIDE3*/2: <UI>:
`x-|l!s>/"5j}
N5###-9>ST4Y9P,LTROCK,HOTSPR,MTIDA,WIDE3*/2: <UI>:
`x-|l!s>/"5j}

I know digi's HOTSPR and MTIDA are KPC3's V9.0. They are set to UIDIGI on wide3-3, wide4-4, wide5-5, wide6-6. I do not know what the other digi's are using. There are no less than 6 full time Igates that hear all of these digi's.

My question is there anything we can do to eliminate these duplicate packets or is this just part of APRS?

Any and all input will be appreciated.

6789. Setup Problem I think

I don't seem to be able to see any current positions of my station, and don't see it on my T2-Nuvi 350 Setup. I think there is something wrong with my setting somewhere. Here is my current setup of my KPC3+. Thanks

From: Stan Coleman - N0YXV
Topic: 6788 Message: 6790

Looks fairly normal to me. You have an operator that has decided that they need to have three hops. That doesn't mean it's limited to 3 hopes it means that the packet will die after going through three digi's in any direction. When you use WIDE3-3 you might wind up with diging through a digi East of you with a WIDE3-2 result. You could also have the same packet go to a digi West of you and the output of that digi also be WIDE3-2. Since the East digi and the West digi can't hear each other they both digi the packet and drop it to WIDE3-2. Picture what it would be like if you had 4 digi's that couldn't hear each other in a ring around you but could hear a common digi near you.

I am wondering why anybody would set a digi to digi on WIDE4-4, WIDE5-5, WIDE6-6. The vast majority of the country doesn't need a path larger than WIDE3-3 for anything.

Side note: An over abundance of IGates don't pose a problem to an RF network unless they are all set to transmit packets to RF. As long as the IGate is only receiving packets it can't plug up the RF network. Any duplicate packets that get into multiple IGates are dropped by the APRS-IS system anyway. The APRS-IS can handle several duplicate packets all within several seconds (or halves of seconds) from each other.

i guess if anyone knows anyone that can help with the aprs in this area PLEASE let me know. my k7cdl-14 is seeing stuff 180 miles away. if you draw lets say 190 miles circle all the way around sheridan,wyoming and look at everyones path and rate times you will see why. i'm not saying i'm perfect and you can see i'm still a new ham but i have done my research. i have no dub-information and dub-turn setting under a min and my fast speed beacon is set to 90 secs. my wide is wide1-1,wide2-2 and that is because of it being wyoming but as soon as i get the digi setup at 6k feet up in buffalo next summer my wide settings will change. i dont want to step on anyones toes and thats why i have gave up on talking to people around here about the aprs network. now that i have setup my Nuvi 350 i cant beleive the stations i'm seeing from MT when i'm in wyoming. i just dont know what to do about the aprs network anymore. i have got to the point of keeping my mouth shut so i stop looking like the bad guy. i have even been asked by sheridan hams to maybe setup a class on aprs to help some people with aprs because of the research i have done and i have said "NO"

Stan,
Thanks for the reply.
All 4 digi's in this example can hear each other. It seems to me there should be some sort of filter at each digi to exclude any traffic from the others. With several igates operating that can also hear all 4 digi's any station that could reach any digi would go through.

Am I missing something and is there such a filter?

Ron
if i may add this link at the discussion
http://wa8lmf.net/DigiPaths/NNNN-Digi-Demo.htm
sometime visual demo is the best to explain things.

i have try many setup myself,because i am using mobile aprs on small
vehicule with lower power (1 watts) i have found wide3-3 be the best
,,,that,s all.
i have one Igate,mine at my qth and i relayed station very far from me
because i have 2 great coverage digi,s setup simple:no fancy adjustement for
me and it worked.

Also if i may add,setup for big city and many digi's are not the same if you
dont want the frequency to be flooded by packets ,,

Anyway wide 3-3 on my Honda Fourtrax and on my Skidoo is a good
setup,,,,,,with 1 watt.
power is another subject,,,,,i saw some mobile with 50 watts,,,,,why????

73/s and great week-end

6795. Re: [APRS] Re: Help with packet bounce between Digi's

Yahoo group: APRS (2007 — 2010)
Date: 2009-11-21 14:28:03 UTC
From: Patrick Domack
Topic: 6788 Message: 6795

The filter is suppost to be the send delay.
Setting the delay to 0, so that all the digi's that hear the packet
transmit it at the same time, this way you don't use up 4 different
time slots, only 1, and only digi's that didn't hear it the first time
would hear it this time, and digi it again. So at the most it would be
digi'd 2 times, instead of 4. (UIDWAIT OFF, DWAIT 0)

N5###-9>ST4Y9P,LTROCK,MTIDA,HOTSPR,WIDE3*/2: <UI>:
`x-|l!s>/"5j}
N5###-9>ST4Y9P,LTROCK,HOTSPR,MTIDA,WIDE3*/2: <UI>:
`x-|l!s>/"5j}

That shouldn't be happening at allthough. Maybe the duplicate
rejection is turned off? (UITRACE WIDE,30 where 30 is the duplicate
time in seconds)
I may be wrong about this, but is the dupicate checking on the whole
packet or just the source/dst/payload? if it is the whole packet I can
see how this isn't working to stop that.

I suppose you could take all the igis that can hear each other and filter out each other. Not sure how you would do that in kPC3 land but I know you can excluded things from being digi'd.

6797. GPS for use with Pico Packet

Yahoo group: APRS (2007 — 2010)
Date: 2009-11-21 20:14:58 UTC
From: Peter Dakota Summerhawk
Topic: 6788 Message: 6797

Morning all,

I was wanting to know what GPS could be used with the Pico Packet from Paccomm? I am looking at running this in my truck along with a CF-19 Toughbook for aprs. They don't make the internal model GPS unit anymore and I would need a GPS that would be compatible wit this unit.

Thanks

Peter Summerhawk-N0WRE

I use a Garmin E-Trex. Works fine.

Well I may have figured out how to do almost that very thing. The answer is: UIDIGI ON WIDE2-2,WIDE3-3,WIDE3-2,WID3-1. This was done on the 2 digi's I control. Anything above wide2-1 is only digied once and not set to be digied by another digi. If you can reach any of the digi-s you will be igated. If you reach 2 digi's at the same time you will be digied by both digi's but not bounced.

Sorry Ron, my solution would not fix stupidity. However with a little explanation as to the problems they caused, we had a couple of guys doing the same thing, change their ways. By the way my solution will not trap wide4 and up. Fortunately we don't see much of that.

> me and it worked.

Gervais, Life is to short for QRP. There might not be an igate monitoring every digi in your area but I would bet at least every other one so wide2-2 or wide2-1 might work just as good.

Sounds interesting. I might give that a try. Wonder what the igate hearing that big data collision would do?

Thanks to all for your input. Wayne, WA5LUY

If the IGates followed the recommendations linked below, it'd be
automatically sorted out.

Another good suggestion. However my Igate is in the middle and I need to look at three of the four digi's.

By the way VE2CKN I stand corrected. I looked at your area on aprs.fi.
All I can say is the internet must be expensieve. Your igate to digi ratio is very low.

And where is this? These are very draconian measures that cut everyone off from any 2 hp RF communications. I havent been following the thread, but the only place I have seen this make sense is in the LA basin and at Dayton for Hamvention. Just curious?

I may be wrong (this is from memory)... But the initial KPC-9.0 roms were bad and cause dupes. They updated it, but I dont have the version number in front of me. If the unit is being used as a digi, it must be upgraded to the newer rom:

>N5###-9>ST4Y9P,LTROCK,MTIDA*,WIDE3-1/2: <UI>:
>`x-|l!s>/"5j}
>N5###-9>ST4Y9P,LTROCK,K5CS-12,MTIDA,WIDE3*/2: <UI>:
>`x-|l!s>/"5j}
>N5###-9>ST4Y9P,LTROCK,HOTSPR*,WIDE3-1/2: <UI>:
>`x-|l!s>/"5j}
>N5###-9>ST4Y9P,LTROCK,MTIDA,HOTSPR,WIDE3*/2: <UI>:
>`x-|l!s>/"5j}
>N5###-9>ST4Y9P,LTROCK,HOTSPR,MTIDA,WIDE3*/2: <UI>:
>`x-|l!s>/"5j}
>
>I know digi's HOTSPR and MTIDA are KPC3's V9.0.

I bet that is the problem, because they are NOT ignoring dups and are re-digipeating them...

> My question is there anything we can do
> to eliminate these duplicate packets...

Udate the roms..

> <UI>:
> `x-|l!s>/"5j}

I may be wrong, but assuming the above five transmissions occurred within a couple of seconds it looks like both MTIDA and HOTSPR have handled the original beacon more than once each.

[1] shows MTIDA transmitting it, and it should be remembering that packet for say 30 seconds and making sure it doesn't repeat it until the 30 seconds has expired, yet it transmits it again in [2]. This implies that MTIDA is not dupe checking as it should, it should be storing the checksum (or whatever it is called) for quite a few seconds, typically 30, to ensure this doesn't happen.

[3] and [4] show HOTSPR doing the same thing.

[5] shows MTIDA transmitting the same beacon yet again, in response to hearing [3].

The above comments (assuming I'm right) suggest that neither MTIDA nor HOTSPR are dupe checking.

HOWEVER- both HOTSPR and MTIDA have heard LTROCK directly. They should both have DWAIT=0 so that they both transmit simultaneously. If they both transmitted simultaneously, we would see a single packet instead of the five listed above. This is known as fratricide.

So the problems seem to be
(1) no dupe checking, and
(2) DWAIT is not 0.

73, David ZL3AI.

Bob,
I am glad you weighed in on this. As Paul Harvey used to say "Now the rest of the story".

This all got started when several guys in an isolated area of the state had UI-View but no internet connection. They convinced one of their members that had internet to gate internet to RF so they could see what was going on around the state. His unproto was set to wide3-3. I suppose that was fine as long he could not reach any high level digi. Well you know what happened. They put up a high level mountain top digi. Fortunately they have changed the unproto to wide1-1.

Before we figured out what was going on with all this traffic we started looking at the dups on our own digi's. Our digi's are KPC3+. I am not sure about the version. It's hard to tell by remote. Most likely they are 9.0. I checked the DWAIT and it is 0. UIDUPE is a good parameter and it is set to 30. I will get the latest version if version 9.0 has problems.

As far as RF communications I assume you meant messaging. Help me understand this. The way we have it set now and an igate is monitoring all digi's. Would a message not go through?

6807. Setup for a semi truck

Yahoo group: APRS (2007 — 2010)
Date: 2009-11-22 19:48:29 UTC
From: Dan Bowkley
Topic: 6807 Message: 6807

Hello all,

I've become somewhat frustrated with my current rig; I do think it's time to move to something I can actually use to send messages both ways rather than just using it as a dumb tracker. At the moment I've got a Yaesu FT-7800R with an Elcom mUSBTNT+ and a Garmin GPS-12. I've tried to get it to work with my laptop (running Ubuntu Linux 9.10) and Xastir, but have had absolutely no luck getting packets to decode into Xastir. I do love the Xastir interface, but if I can't make the ****ing thing work...where's the point?

I'm kinda torn between the TinyTrak4 and going whole-hog for a D710...I dunno. I think the GPS can stay, it's been rock-solid reliable and in fact hasn't had to be reset in about two years now; the radio is great but I'd kinda like to be able to monitor 146.52 as well as have APRS going--which points to the D710 (or another two-in-one rig). My laptop only has USB ports, so something akin to the mUSBTNT would be nice--if and only if it actually works! At the same time I'll have to have something that I can tuck away easily while I'm driving (since txting and driving a 40 ton truck at the same time isn't exactly safe) but I like full-size keyboards. I do also have a Garmin Nuvi 465T; maybe this can be made to interface?

Does anyone have any suggestions for a good rig that'll be reliable, has a single interface on the laptop (without having to switch from Linux, with which I'm madly in love) and just plain works?

Thanks
Dan KG6OHK

Were it me, I'd go with the D710. I do not like messaging with the mic but it is simpler than hiding the keyboard from DOT. There was a guy selling a keyboard interface for the D700 (http://www.coastalchip.com/kenkey.htm) but he says it will not work with the D710.

Either way, I'd prefer the single radio approach for those times you may need to slip-seat.

Dunno about the Xastir part of things, but I LOVE the '700 in the rig. I've logged around 900k with the current setup with no problems. The little bit I have used the radio with a laptop and Aprs+ has also been trouble free.

Thus the reason I run Windows, there's more failures because there's more than two pieces of software that work with it!

I own the truck, so portability isn't really an issue; if I get another radio etc I'll probably move this rig into my 4wheeler for (the rare time) when I'm home. Having a second GPS for APRS might confuse my students (yeah I'm a trainer, no I don't sleep much :D) a bit less than having weird messages all over the main navigation GPS...if I were solo I'd try and get it working on the 465T (can it be made to work? anyone? Bueller?) but I'm thinking it'd probably be good to turn the ham stuff off while Mr. Newb is driving.

Has anyone had any experience with the new Elcoms? I'm kinda thinking about one of these: http://www.elcomresearch.com/shop/item.aspx?itemid=15 but having had such horrid luck with my old one...I just dunno if I can swallow another $150 pill that doesn't work. That Tracker2 does look like a mighty fine gizmo, and it's "open" which I very much like. Just double-stick tape it to the top of my radio (which is itself double-stick taped to the top of the dashboard) and hey presto.

Ya know I kinda think I've seen you plying around I80...I don't run up there that often but I'll keep an ear peeled for you.

Hi Dan, and others,
I would recommend either the TT4 connected to your 7800.
Or (as you say) go the whole hog and get the 710.
I have a 710 and use it just as you describe. With a laptop and ui-view.
The TT4 will also do the same on your 7800 but you will need another rig to monitor the other chanel.
Hope that helps.
Robin ZL3REW

Subject: [APRS] Setup for a semi truck

Hello all,

I've become somewhat frustrated with my current rig; I do think it's time to move to something I can actually use to send messages both ways rather than just using it as a dumb tracker. At the moment I've got a Yaesu FT-7800R with an Elcom mUSBTNT+ and a Garmin GPS-12. I've tried to get it to work with my laptop (running Ubuntu Linux 9.10) and Xastir, but have had absolutely no luck getting packets to decode into Xastir. I do love the Xastir interface, but if I can't make the ****ing thing work...where's the point?

I'm kinda torn between the TinyTrak4 and going whole-hog for a D710...I dunno. I think the GPS can stay, it's been rock-solid reliable and in fact hasn't had to be reset in about two years now; the radio is great but I'd kinda like to be able to monitor 146.52 as well as have APRS going--which points to the D710 (or another two-in-one rig). My laptop only has USB ports, so something akin to the mUSBTNT would be nice--if and only if it actually works! At the same time I'll have to have something that I can tuck away easily while I'm driving (since txting and driving a 40 ton truck at the same time isn't exactly safe) but I like full-size keyboards. I do also have a Garmin Nuvi 465T; maybe this can be made to interface?

Does anyone have any suggestions for a good rig that'll be reliable, has a single interface on the laptop (without having to switch from Linux, with which I'm madly in love) and just plain works?

Thanks
Dan KG6OHK

I'm interested in getting my feet wet in APRS. Use would be primarily location tracking in the mobile, traveling frequently between North Carolina and New Jersey to visit grandchildren. I'd like to be able to integrate my Dell Inspiron Laptop with either my Garmin E-Trex Legend C or Nuvi 255W. Santa will be supplying a new Kantronics KPC-3+. I'd like to be able to use my Yaesu FT-60R handheld as the transceiver. Can anyone provide recommendations re software, equipment integration, etc., or share their experiences with similar setups? Many thanks.

the nuvi 350 is a little better because its know for not duplicates waypoints as you can see from the information on this site http://wiki.argentdata.com/index.php/Garmin_FMI also don't forget the nuvi gps doesn't do NMEA you would have to have the GTRANS Garmin to NMEA Translator Cable. in my opion there is cheaper and better ways to add aprs in mobile then the Kantronics. my opion the best setup is a Nuvi 350 with the Tracker2 OT2m because then you can do aprs message direct from the gps as you can see here http://paulsnet.org/nuviv1.pdf if you do the Tracker2 OT2m you wont need a special data cable because the OT2m does the garmin format.

Hi Marc,

I use a Kenwood TM-D710 dual-band (which contains it's own TNC), along with a Garmin 276c. The last responder is correct in that the Nuvi 350 - which you can still purchase used/refurbished - does not exhibit the "breadcrumb" problem inherent in other Garmin GPSrs. As an APRS object moves in space, the Nuvi will in effect move that object's waypoint marker, instead of placing a new marker and leaving older markers on-screen.

You can purchase APRSPoint, which makes use of MS MapPoint. I use APRSP - not in the car, but in my shack. You can purchase it stand-alone, or bundled with MS MapPoint (aprspoint.com). The quality of maps is what sets this product apart. It plots RF and APRS-IS objects on my laptop. There is also an APRSPoint Yahoo Group. You would use it to plot RF-received objects and you can send messages as well.

Many use IUView32 but I like the MS Mappoint integration of APRSPoint. You'd use the radio and GPSr as inputs to APRSPoint. If you have a newer laptop, you'll most likely use a USB-to-Serial cable converter. Be very careful because some of these work with this application and some don't. This seems to be the nature of these converter cables; the issues are not limited to use with APRSPoint either. I use a dual headed USB-to-Serial cable. 1 USB connection cabled to 2 db9 females. Here is a link for the USB-to-Serial cable. There is a parallel link for the 2-headed variety. Note that this vendor supplies Win7 support:

http://commfront.com/USB-Serial-Adapters-Converters/USB-RS232-Converter-Adapter.htm

I can attest to the quality of this cable.

You will need to purchase or assemble a cable from the radio to the TNC, and from the TNC to the laptop, and another cable from the GPSr to the laptop. These latter cables are readily available. You will also need to mount the laptop, gps and radio safely in your car.

A note: Any GPS that outputs NMEA sentences will suffice.

Anyway, that should get you started; any questions, please post them here.

6819. KPC 3+ issue

Yahoo group: APRS (2007 — 2010)
Date: 2009-11-24 17:09:56 UTC
From: ka9szx
Topic: 6819 Message: 6819

Hello:

Recently acquired a KPC3+ that I am using as a digi. I am having some issues with getting the beacon time set.

No matter what I do I cannot change the BLT which sits at 12:00:00. I also cannot change baud rate to the computer-locked in at 9600.

I tried to follow the information in the manual but it is not very clear. Is there some command I am forgetting or is this thing corrupted?

Everything else appears to function and it is working as a digi. I hate to wipe it out and start all over but it is looking like that is what is needed.

6820. Re: [APRS] KPC 3+ issue

From: Greg Lundell
Topic: 6819 Message: 6820

There are 4 slots for BLT. Here is a sample for the settings:

BLT 1 EVERY 00:30:00 START 00:00:00
BLT 2 EVERY 00:30:00 START 00:10:00
BLT 3 EVERY 01:00:00 START 00:20:00
BLT 4 EVERY 01:00:00 START 00:50:00

You must identify which one you are changing.

Hope that helps.

6825. <Suggestions >

Yahoo group: APRS (2007 — 2010)
Date: 2009-11-25 07:07:43 UTC
From: w1fji@embarqmail.com
Topic: 6825 Message: 6825

A couple of weeks ago I drove from Florida to Massachusetts on I-95 monitoring 146.52 as well as on the return trip via route 81 across the Smoky Mountains to I-75 and back into Florida. I found VHF to be useless for that purpose. All the while my APRS station in the back of the van was beaconing. It was nice to see where I went on the APRS maps.fi but there must be more to it than that. My APRS station consists of a an HT running 5 watts and a TT3+. Obviously beaconing is half of what must be going on. I am thinking of up grading to something so that I can do some texting, with who I have no idea but never the less maybe on my next trip north the drirve will be more interesting.

Up grading but to what. I am looking for suggestions, I am retired so I am on a small fixed income.

All suggestions are welcome.

Tks 73, Art W1FJI

>

Here is a hint!

Type your changes into Notepad, following is a an example of what it should look like.

```
BEACON E 10
BLT 1 E 00:30:00 START 00:00:00
BLT 2 E 00:30:00 START 00:10:00
BLT 3 E 01:00:00 START 00:20:00
BLT 4 E 01:00:00 START 00:50:00
BTEXT ;147.135NH*111111z4258.99N/07135.36WrT100 r25m S.Uncan MT
CD SOFTWARE
CMSG DISC
DIGIPEAT ON
```

When the changes are typed up, sent it to the KPC3+ via a terminal program. I use Hyper Terminal. I copy it from the file and paste into the terminal program window. One issue with HT is you will need to do Toolbar>Edit>Paste to Host. The CTRL-V option doesn't work properly in this instance.

If you always start with a hard reset, then you can load parameters quickly. And, by changing one or two settings at a time, you can get to where you want to be be. By typing each line in, I ended up changing seom parameter that shut everything down. I had to do a hard reset to recover. That is when I started doing the above. Saves a lot of time. Another feature is I can send the file to someone else and all they need to do is change a couple of settings and away they go.

Good luck!
Fred

PS. It looks like there is a new paradigm. Check with WB4APR's site and check it out. He is promoting adding Echolink nodes, etc. to the lineup.

PSS. Also check out the NWAPRS site for digis, fill-in, etc. Very, very helpful!!!!

For fairly short money, you can get bidirectional data. Check out the Argent Data systems Tracker2 and the Byonics TinyTrak4. I have each but currently run only the Tracker2 in my vehicle. Couple the Tracker2 to a Nuvi350 and you can see other stations and TX/RX messages.

But, without changing anything, on your next trip, set up for Voice Alert. My last trip I made a contact as I traveled south on I-81 in MD with someone in the Greenbriar State Park. It was really exciting!

Check out!
http://www.aprs.org/VoiceAlert3.html

Best regards,
Fred

If you open a terminal session (Hyperterm, Teraterm) and do a 'show all' (forget actual command right now) you can copy that to a text file. Then after the had reset you can Paste the contents of your text file back into the terminal session after the KPC3 has been reset.

Sorry I know I'm not giving FULL instructions but hopefully I've given you enough to figure the rest out.

Mark -

Happy to see that you have a Digipeater operating in my old hometown!
For the KPC-3+ , you sometimes have to remove the battery and do a hard reset to clear out settings. What version of ROM (firmware) in this KPC-3+ ??
8.2; 8.3; 9.0 or 9.1 ??

The 9.0 version had coding issues, that Kantronics replaced, when these were new.

Hi Greg:

I am not 100% sure of what software version I am running on this KPC3+ as my initial welcome message is mostly missing. My initial thought would be to lower the baud rate on the TNC and Hypertem to say 2400 and see if that makes a difference.
I do plan on heading out later today (pending no Murphy showing up here at work) and spending some time with it and trying out the tips I have seen from Bob and the others. I will go ahead and report back what I find here. Been a long time since I have played with a TNC. Once I get this thing operational you can use it to come back thru and visit.

Now where did I put that Tiny 2.......

I purchased for use with APRSPoint on a new laptop, the 2-headed variety.

Tested on a desktop and it works, but rather upset about the quality
of the D-9pin shells. Covered in rust.

Reg.

Hi Fred

Is it ONLY the Garmin Nuvi350 that will work correctly in this application?
Will he Wide screen Garmin NUVI 255 w and/or other NUVI GPS work correctly
in this application?
Thank you,

Pat

For fairly short money, you can get bidirectional data. Check out the Argent
Data systems Tracker2 and the Byonics TinyTrak4. I have each but currently
run only the Tracker2 in my vehicle. Couple the Tracker2 to a Nuvi350 and
you can see other stations and TX/RX messages.

But, without changing anything, on your next trip, set up for Voice Alert.
My last trip I made a contact as I traveled south on I-81 in MD with someone
in the Greenbriar State Park. It was really exciting!

Check out!

Presently only the nuvi 350 can display waypoints without making duplicates. There's a rumor that Garmin may change that for their new models, but I haven't heard anything more on it in a month or more.

Maybe you are in NEWUSER mode which has a limited set of commands. Try
entering INTFACE TERMINAL at the cmd: prompt and see if that expands
you're command set. Page 55 of the Rev D manual.

Good luck,
Stan/KC7EHJ

Besides the breadcrumb issue, the FMI cable for the Nuvi 255, PN 010-11259-00, lists at $99 vs $21 for PN 010-10813-00, used on the Nuvi 350.

I'm pretty sure the 11259 cable includes the traffic receiver. The
11232 cable is considerably cheaper. Still overpriced, of course - I'm
sure that's where Garmin makes a lot of their profit.

Yup. Garmin lists it as FMI 40, DATA and Traffic. However, it also says replaces 010-11232-00. The latter lists at $50, but does not have a compatibility list.

Yes, I kept looking for it. I had just re-established access to this
group, so maybe it is a new user-moderated or something procedure...

Let us know if you successful in updating your KPC-3+.

I use a non-plus KPC-3 for APRS I-Gate, but it has never been operated
any way other than in KISS mode with UI-View.

Cheers and 73,
Stan/KC7EHJ

From: Bob Bruninga
Topic: 6841 Message: 6841

Remember that a lot of your fellow hams will be on the road this weekend, and lots of opportunity to qso fellow travelers.

Even if you don't travely yourself, watch your map for those that might drive through your area and make a contact.

While you are at it, make sure every digi is providing the information service for those visitors. See www.aprs.org/localinfo.html

As you drive you should see on your APRS radio, the locally recommended frequency object, and any IRLP or Echolink objects. If not, get on the local repeater and enlighten them to the need to service their area.

Bob, WB4APR

i'm getting errors on a 64 bit laptop running windows 7 home. I've tried the backward compatibility feature and still receive the error about x32 / x64. is there a workaround? or am i stuck with no mapping for ui-view.

can i take the folder from another setup, move it, transfer the ocx file and edit the registery manually and it work? anyone?

This doesn't work. neighter does running it as admin, or changing the backwards compatibility selelection to xp, 98,95, 2000, or anything else. It appears this is strictly written for 32 bit and doesn't want to work with 64 bit.
any thoughts?

Which APRS software are you running?
With UI-View, I read that folks who struggle with Precision Mapping
and PMap Server 7 haven't been following the one and only installation
procedure (which I don't really care about since Precision Mapping
isn't a practical tool here)
Anyway; there is a strict installation procedure, and it seems to be
available somewhere in the files section of the yahoo UI-View group or
at wa8lmf's web site.

that right, except for the fact he mentions using a 64 bit os.
ui-view installs fine, precision mapping installs IF you run it for the first time with admin rights, but, it's the pmapserver setup that i can not get to isntall due to compatibility issues, and NO where does it apear these have been resolved. so for now, i will be formatting and installing xp 32 bit on a 64 bit system :(
really wish some of these developers would get into the future and stop running old 16,32 bit programs only

If UI-View is what is used, a question in the UI-View grouop might be
a good idea.
There have been a few threads about W7-64 with UI-View as well.

yes, but ui-view works.

it's pmapserver7 that has the issue in my case. jsut posting here in hopes some one has my problem and has a solution

Are you the same person as Rev Robert E Spencer who was the original
poster of this thread?

Anyway, if the issue is with PMapServer and Precision Mapping in
combination with UI-View and some OS, the UI-View group will probably
have some help for you.

Even if it's not UI-View but just PMapServer, I know there's been LOTS
of activity on the UI-View group about either/both of those with respect
to Windows 7. I suspect you'll get better responses there than here.

The following is one of a series of articles I found on a SYSOP site and I thought I would pass it on since it appears to be relevant to this discussion, though slightly off topic:

Software Compatibility
When Vista was released, many independent software vendors (ISVs) were not prepared, even though, it was the longest beta phase in the history of Windows releases. Because of the huge structural changes, quite a few applications didn't run properly on Vista. I think, this was the main reason why Vista x64 was not really an option for most organizations that were planning an upgrade, as the move to 64-bit would have only caused additional headaches.

This will definitely be different when Windows 7 comes out. Windows 7 doesn't introduce significant under-the-surface changes. Therefore, almost all applications that work on Vista will work on Windows 7. Meanwhile, all software vendors have already changed their focus to Vista, which means software compatibility problems will no longer be an issue, as far as Windows 7 x86 is concerned.

However the risk of running into software compatibility problems is still bigger with Windows 7 x64 than it is with Windows 7 x86. But, I am sure that it is now significantly lower than it was when Vista first came out. The good thing is that Vista requires a lot more RAM than its predecessor, which has already forced many users (me, for example) to move to 64-bit, thereby increasing the likelihood that ISVs have fixed possible 64-bit issues in their applications as a result of customer feedback.

If you are uncertain if software will run on Windows 7 64-bit, then you can try it first in a virtual environment like VMware Workstation or Oracle's free VirtualBox. Of course, if you plan to deploy Windows 7 in your network, then you will have to test all your applications anyway. Just make sure that not only the application itself but also its setup programs run on 64-bit, because some legacy apps still use 16-bit installation programs. 16-bit and MS DOS binaries won't run at all on Windows 7 x64.

This article was quoted from the following source:

http://4sysops.com/archives/windows-7-64-bit-vs-windows-7-32-bit-hardware-and-software-compatibility/

There are other discussions which cover VISTA x86 vs VISTA x64 compatibility issues at this site too. Note the article box on the upper right of the article on this web page.

Topic: 6852 Message: 6852

I will ask my question first, and give the info next.

Question:
Does the APRSIS figure out if an igate is RX only, or does 2-way communication just use a reverse path to get back to the first station?

Info:
I have a TT4 with Display. I am attempting to send test e-mails so I have another way of getting info somewhere. I run a Digi/iGate about 10 miles south of town, on a hilltop, running as W1, and TX iGate ability.
I also run a RX-only igate at my house, and there is another igate in town that is set for RX-Only, (I think TX is just disabled in the interface).

When I send a message, the other station recieves me, and replies back, but I never recieve the Ack, or the reply. Sometimes I do, but it may not be for a good while via the Digi/igate.

My Area:
http://aprs.fi/?lat=35.5507&lng=-117.6979&mt=m&z=11&timerange=3600

KI6PSP-10 is my WRT54GL running OpenWRT
KI6PSP-10>APRS,TCPIP*,qAC,T2SOCAL:>TinyTrak4(KISSTNC)-WRT54GL iGate

WI6RE is the Digi that I maintain.
WI6RE>IWV,qAR,KC7VYX-1:=S<T4v0drT# BPHG67301/W1,ElPasoPeak>iwvaprs.net {UIV32N}

KC7VYX-1 is the other igate
KC7VYX-1>APX190,TCPIP*,qAC,T2SOCAL:=3537.61N111740.99W&XASTIR-Darwin

Upon referancing the APRS Table:
http://wa8lmf.net/miscinfo/APRS_Symbol_Chart.pdf

I found that I am using R& for my symbol, and I believe the KC7VYX-1 is using 1&.

When I try to send a message, this is the result, but I think because KC7VYX-1 is RX only, I don't get the return message traffic. I will get it if the WI6RE Digi gates me.

I think you folks have been successfully confused by the Microsoft Marketing Department.

There are two main differences in the ways that Vista (properly called NT6) and Windows 7 (properly called NT6.1, yes, it is just a "dot one" upgrade not a whole new OS) handle software.

DRIVER software for hardware, has to be totally different in a 64-bit OS, so the 64-bit OS becomes a relevant point for hardware drivers. The pmapserver software is not a hardware driver, so that should not be an issue.

However, the 64-bit versions of Windows no longer support 16-bit software. Which means that old old DOS and Win3.x programs and even some Win9x programs will not run under a 64-bit version of Windows. (I'm not sure if XP/64 supported them, but Vista and Win7 do not.)

The odds are that the old pmapserver software, written by a small developer a long time ago, is still using 16-bit code or relying on some "extra" (extensions to the OS) that are equally obsoleted.

The only way to find that out without wasting a lot of time, is to CALL UNDERTOW SOFTWARE DIRECTLY and ask them. Assuming they're still in business, you should have the real answer in about two minutes.

One work around that I have heard about is to run a 32 bit
virtual machine on your high powered 64 bit system.

6855. ui-view, pm8 and pmapserver 7

Yahoo group: APRS (2007 — 2010)
Date: 2009-11-30 00:37:00 UTC
From: mindbender2995
Topic: 6855 Message: 6855

windows 7 64 bit turned out to be an EASY install.

first : install fresh copy of ui-view

reboot

second : from an old working install of ui-view, copy t he entire folder, and copy it directly to the program files (x86) peak systems directory over writing what needs to be over written

third : copy the entire pmap7 folder to the peak systems folder

install pm7 or 8

register the pmapserver7.dll AS ADMIN thru a command prompt like this:

1: right click desktop select 'new'
2: make a new shortcut
3: the command to launch should be "cmd"
4: hit enter
5: shift right click and select 'run as admin'
6: hit enter
7: double click and type regsvr32 pmapserver7.dll
8: enjoy feeling of excitment when it says registered
9: launch ui-view and maps are there. if not you get prompt to tell ui-view where the mapping data is...that's pretty much like last time

I get the following Error Message when I run regsvr32 pmapserver7.dll
as an administrator: "The module Pmapserver7.dll failed to Load" Also I am unable to run the Pmapserver7 installer, under any conditions. I did copy the peak folder to my program folder after installing UI-View and rebooting. Did I miss a step? Thanks

pmapserver isn't written by Undertow, but (originally by G4IDE (now SK))as an add-on for UI-View in order to combine Undertow's Precision Mapping with UI-View.
There is a recent file with instructions for UI-View/PMap Server 7/Precision Mapping 8/Windows 7 in the files area of the UI-View yahoo group.

i failed to give you the most important piece of the puzzle.
when you go to register the pmapserver7.dll, either make sure the path to the file is IN the command, or, cheat like i and a few others have, and simply copy it from the pmapserver folder to the 'ROOT' of c: . then open the admin prompt you made, (check and make sure you run it as admin each time) and run the regserver 32 thing. if you get an error with a bunch of numbers after it, that simply means you weren't administrator. try it again with admin rights.
Side note, disable a virus scanner for this step if you continue to have problems
